

Contents

1	Introduction	1
I	Fundamentals	9
2	Basic Mathematical Environment	11
2.1	Basic Notation	11
2.2	Complexity Theory	11
2.3	Optimization Problems	12
2.4	Graph Theory	14
2.5	Network Flows	16
2.6	Cooperative Game Theory	17
3	Modeling a Combinatorial Energy Exchange	21
3.1	Problem Description	21
3.2	Related Literature	22
3.3	Modeling Goals	23
3.4	A Six-Stage Exchange Model	30
3.5	Conclusion	32
II	Bidding and Distribution in Combinatorial Exchanges	35
4	The Robust Minimum Cost Selection Flow Problem	37
4.1	Introduction	37
4.2	Problem Definition	39
4.3	Complexity and Approximation	40
4.4	The Adjustable Robust Counterpart	42
4.5	The Robust Winner Determination Problem	53
4.6	Conclusion and Outlook	61

5	The Reward-Penalty-Selection Problem	63
5.1	Introduction	63
5.2	Problem Definition and Complexity Results	65
5.3	Problem Variants	71
5.4	Application as a Graph Theoretical Problem	84
5.5	Application as a Combinatorial Game	87
5.6	Conclusion and Outlook	94
6	The Almost Equal Flow Problem	97
6.1	Introduction	97
6.2	Problem Definition	99
6.3	Complexity and Approximation	100
6.4	The Constant Deviation Case	102
6.5	Problem Variants	108
6.6	The Minimum Cost Flow Variant	113
6.7	Conclusion and Outlook	118
III	Profit Sharing in Combinatorial Exchanges	121
7	Individual Scaled Vickrey Payments and the Egalitarian Allocation	123
7.1	Introduction	123
7.2	Some Notes on Vickrey Payments	125
7.3	Some Notes on the Egalitarian Allocation	126
7.4	The Connection Between the ISV-Payments and the Egalitarian Allocation	129
7.5	Application to Flow Games	133
7.6	Conclusion and Outlook	139
IV	Closing	141
8	Conclusion and Future Research	143
	Bibliography	147
A	Some Combinatorial Problems	155
B	Numerical Study of the Robust MCFSP	157
B.1	Analysis: Running Time	157
B.2	Analysis: Flexibility	160
B.3	Analysis: Robustness	160
