

Contents

1	Introduction	1
1.1	Objectives of the work	3
1.2	Outline	4
2	State of the art	5
2.1	Basics of induction heating	5
2.2	Induction heat treatment equipment	9
2.3	Induction hardening	12
2.3.1	The iron-carbon (Fe-C) phase diagram	12
2.3.2	Phase transformations during quenching	14
2.3.3	Austenitization and short-time austenitization	18
2.3.4	Residual stress	20
2.4	Induction tempering	21
2.4.1	Phase transformations during tempering	21
2.4.2	Residual stress	24
3	Mathematical models of the direct problems	25
3.1	Magneto quasi-static Maxwell's equations	25
3.1.1	Potential formulation	26
3.1.2	Finite Elements	27
3.1.3	Equivalent permeability in time-harmonic analysis	29
3.2	Heat transfer equation	31
3.3	Phase transformation equations	32
3.3.1	Short-time austenitization	32
3.3.2	Diffusion-controlled transformations during quenching	34
3.3.3	Martensitic transformation	36
3.3.4	Diffusion-controlled transformations in tempering	37
3.3.5	Hardness	38
3.4	Mechanical equations	39
3.5	Multi-physical coupling	42
4	Optimization for inverse problems	45
4.1	Single- and multi-objective optimization	45
4.1.1	Meta-heuristic algorithms	46
4.2	On the use of surrogates	49
4.2.1	Kriging (GP)	50
4.2.2	Radial Basis Function (RBF)	52
4.2.3	Neural Networks (NNs)	53

4.3	Multi-fidelity surrogates	57
4.3.1	Co-Kriging	57
4.4	Exploiting parallel computing	59
4.5	Implemented algorithms	60
4.5.1	Self-adaptive multi-objective algorithm	60
4.5.2	Multimethod GP-based bi-fidelity parallel algorithm	64
4.5.3	Multi-surrogate multi-objective parallel decision-based algorithm	67
5	Influence of microstructure on electromagnetic properties	75
5.1	Measurement of the electrical resistivity	75
5.2	Identifying the magnetic properties	76
5.2.1	A mathematical description of the $B - H$ curve	77
5.2.2	Experimental setup	79
5.2.3	Field analysis	80
5.2.4	Inverse problem formulation	81
5.2.5	Results of optimization	82
5.3	A microstructure-dependent time-harmonic FEM model	83
5.3.1	Equivalent curves for time-harmonic simulations	83
5.3.2	Model simplifications	85
5.4	The dependence of permeability on temperature	87
6	Using neural networks in magnetic properties identification	93
6.1	Neural networks as multi-fidelity surrogates	93
6.1.1	A multi-fidelity Pareto-optimal neural network to describe the forward problem	94
6.1.2	Solving the inverse problem of $B - H$ curve identification	96
6.2	A ready-to-use network for inverse $B - H$ identification	98
7	Model and design of induction hardening-tempering processes	103
7.1	Structure of the numerical models	103
7.1.1	Material data for induction hardening	104
7.1.2	Material data for induction tempering	107
7.2	Model's validation	108
7.2.1	Based on laboratory scale experiments	109
7.2.2	Based on industrial scale experiments	110
7.2.3	Influence of a microstructure-dependent electromagnetic analysis	117
7.2.4	Microstructural model	118
7.2.5	Mechanical model	122
7.3	Optimal frequency and heating time in the hardening process	123
7.4	Optimal control of the tempering process	125
7.5	Exploiting the residual heat in quenching	129
8	On the use of neural networks for solving Fourier's and MQS Maxwell's equations	133
8.1	MQS Maxwell's equations in frequency domain	134
8.1.1	Linear equations	134

8.1.2	Non-linear equations neglecting hysteresis losses	138
8.1.3	Non-linear equations including hysteresis losses	140
8.2	MQS Maxwell's equations in time domain	142
8.2.1	Linear equations	142
8.2.2	Non-linear equations neglecting hysteresis	143
8.2.3	Non-linear equations including hysteresis	144
8.3	An electromagnetic-thermal coupled analysis for induction heating	145
9	Conclusions	149
