1 Introduction	1
References	4
2 Matter under Extreme Conditions: Classification of States	7
References	20
3 High Energy Densities in Laboratories	25
3.1 Main Lines of Research	25
3.2 Generators of High Energy Densities	29
3.3 Static Methods Using Diamond Anvils	39
3.4 Dynamic Methods	41
3.5 Light-Gas Guns or Chemical and Nuclear Explosions	47
3.6 Quasi-classical Model of a Substance	54
3.7 Devices of High-Current Impulse Energetics	61
References	67
4 High-Power Lasers in High-Energy-Density Physics	75
References	88
5 Relativistic Charged Particle Beams	97
5.1 Production of Macroscopic Hot Plasma Volumes	101
5.2 The Nuclear Matter Phase Diagram and Quark–Gluon Plasma	107
5.3 Low-Energy Scan Experiments with Heavy Ions at the NICA Collider	129
References	136
6 Technical Applications of the Physics of High Energy Densities	143
6.1 Laser Inertial Confinement Fusion	144
6.1.1 Direct Drive	144
6.1.2 Indirect Drive	150

- 6.1.3 Fast Ignition 153
 - 6.2 Heavy-Ion Beam Fusion 156
 - 6.3 Laser-Plasma Acceleration of Charged Particles 157
 - 6.4 Free-Electron Lasers and Ultrashort High-Intensity Radiation Sources 167
 - 6.5 Plasma in Accelerators 173
 - References 174
- 7 Astrophysical Aspects of High Energy Densities 185**
 - 7.1 Planets, Exoplanets, Substars, and White and Brown Dwarfs 190
 - 7.2 Superextreme States: Neutron Stars, Black Holes, Magnetars, and Wormholes 224
 - 7.3 Cosmic Jets, Radiative Shock Waves, and Molecular Clouds 251
 - 7.4 Cosmic Rays 282
 - 7.5 Gamma-Ray Bursts 286
 - 7.6 Matter Transformation after the Big Bang 294
 - References 314
- 8 Conclusion 331**
 - References 332
