Preface — IX

About the authors — XVII

Chapter 1

Segment search approach for the general linear integer model — 1

- 1.0 Introduction — 1
- 1.1 The Linear Integer Programming (LIP) Model and some preliminaries — 2
- 1.2 The concept of segments — 3
 - 1.2.1 Selection of the segment interval — 4
 - 1.2.2 Decreasing the objective value — 6
 - 1.2.3 Original variable sum limit — 7
 - 1.2.4 Determination of h_0 value — 8
- 1.3 Segment-search approach — 8
 - 1.3.1 General integer model — 8
- 1.4 Mixed integer model — 9
- 1.5 Numerical illustration — 11
 - 1.5.1 General linear integer model: Example 1.1 — 11
 - 1.5.2 Solution by the proposed segment-search algorithm — 12
 - 1.5.3 Mixed integer model: Example 1.2 — 13
- 1.6 Conclusions — 16
- References — 17

Chapter 2

Improved solution method for the 0-1 GAP model — 19

- 2.0 Introduction — 19
- 2.1 Generalized assignment problem — 20
- 2.2 Relaxation process — 21
- 2.3 GAP model in relaxed form — 21
- 2.4 The relaxed transportation model — 22
- 2.5 GAP transportation branch and bound algorithm — 23
 - 2.5.1 Optimality — 23
 - 2.5.2 Numerical illustration — 23
- 2.6 Improved solution method for GAP — 28
 - 2.6.1 Proposed algorithm — 28
 - 2.6.2 Strength of proposed algorithm — 28
 - 2.6.3 Reconsider the same numerical example — 28

2.7	Conclusions — 30
	References — 31

Chapter 3

A search for an optimal integer solution over the integer polyhedron – Two iterative approaches — 33

3.0	Introduction — 33
3.1	Background information — 34
3.1.1	Geometry of integer-points in a convex space defined by the linear constraints — 35
3.1.2	Optimality of the solution — 37
3.2	Young's primal integer programming approach (1965) — 37
3.2.1	Numerical Illustration of Young's primal approach — 38
3.3	The Integer Polyhedron Search Algorithm (IPSA) — 43
3.3.1	Integer Polyhedron Search Algorithm (IPSA) by Munapo, Kumar and Khan (2010) — 46
3.4	More numerical illustrations of IPSA — 47
3.5	Concluding remarks — 50
	References — 50

Chapter 4

Use of variable sum limits to solve the knapsack problem — 53

4.0	Introduction — 53
4.1	The knapsack model — 54
4.2	Development of the variable range for a knapsack problem — 54
4.2.1	Variable range — 54
4.2.2	Objective value upper bound — 54
4.2.3	Objective value lower bound — 55
4.2.4	How to overcome this challenge? — 56
4.2.5	Variable sum bounds and subsets — 56
4.2.6	Subsets of variable sum bound — 57
4.3	Variable sum bounding algorithm — 58
4.3.1	Algorithm — 58
4.4	Numerical illustration — 60
4.5	Conclusions — 63
	References — 63

Chapter 5

The characteristic equation for linear integer programs — 65

5.0	Introduction — 65
5.1	Development of a characteristic equation for a pure linear integer program — 67

5.1.1	Analysis of a trivial example —	67
5.1.2	The characteristic equation —	71
5.1.3	Some interesting properties of the CE —	72
5.1.4	An algorithm to find the k^{th} best optimal solutions, $k \geq 1$ using the CE approach —	73
5.1.5	Features of the CE —	74
5.1.6	A numerical illustration —	75
5.1.7	An ill conditioned integer programming problem —	77
5.1.8	Analogies of the characteristic equation with other systems and models —	78
5.2	The ordered tree method for an integer solution of a given CE by Munapo et al. (2009) —	79
5.2.1	A Numerical illustration of the ordered tree search technique —	81
5.3	The CE for the binary integer program —	82
5.3.1	Numerical illustration of a binary program —	82
5.4	CE applied to a bi-objective integer programming model —	84
5.4.1	Numerical illustration for bi-objective model —	84
5.5	Characteristics equation for mixed integer program —	86
5.5.1	Mathematical developments —	86
5.5.2	A characteristic equation approach to solve a mixed-integer program —	88
5.5.3	Numerical illustration – MIP 1 —	89
5.6	Concluding remarks —	92
	References —	93

Chapter 6

Random search method for integer programming — 95

6.0	Introduction —	95
6.1	The random search method for an integer programming model —	96
6.1.1	Integer linear program, notation, and definitions —	96
6.1.2	The random search method for integer programming —	97
6.1.3	Reduction in the region for search —	98
6.1.4	The algorithm —	98
6.1.5	Numerical illustrations for an integer program —	99
6.2	Random search method for mixed-integer programming —	101
6.2.1	The mixed-integer programming problem, notation and definitions —	101
6.2.2	Steps of the random search algorithm —	102
6.2.3	Numerical illustration —	103
6.3	An extreme point mathematical programming problem —	104

6.3.1	Mathematical formulation of an extreme point mathematical programming model —	105
6.3.2	Problems that can be reformulated as an extreme point mathematical programming model: Some applications —	106
6.4	Development of the random search method for the EPMP model —	109
6.4.1	Randomly generated solution —	109
6.4.2	The number of search points —	109
6.4.3	Reduction in search region or a successful solution —	109
6.4.4	A feasible pivot for an EPMP —	110
6.4.5	Algorithmic steps —	111
6.4.6	Illustrative example 6.4 —	111
6.5	Conclusion —	115
	References —	116

Chapter 7

Some special linear integer models and related problems — 119

7.0	Introduction —	119
7.1	The assignment problem —	120
7.1.1	Features of the assignment model —	121
7.1.2	Kuhn-Tucker conditions —	122
7.1.3	Transportation simplex method —	122
7.1.4	Hungarian approach —	122
7.1.5	Tsoro and Hungarian hybrid approach —	123
7.2	See-Saw rule and its application to an assignment model —	123
7.2.1	Starting solutions —	125
7.2.2	See-Saw algorithm —	125
7.2.3	Numerical Illustration 1 —	125
7.2.4	Proof of optimality —	127
7.3	The transportation problem —	127
7.3.1	Existing methods to find a starting solution for the transportation problem —	128
7.3.2	Transportation simplex method —	129
7.3.3	Network simplex method —	129
7.3.4	The method of subtractions for an initial starting solution —	130
7.4	The See-Saw algorithm for a general transportation problem —	138
7.4.1	A General transportation model —	138
7.4.2	The assignment-transportation model relationship —	139
7.4.3	See-Saw rule for the transportation model —	140
7.4.4	Initial position before the See-Saw move —	141
7.4.5	See-Saw algorithm for the general transportation model —	142
7.4.6	Numerical illustration of transportation model —	143

7.5	Determination of k^{th} ($k \geq 2$) <i>ranked optimal solution</i> —	149
7.5.1	Murthy's (1968) approach —	150
7.5.2	Minimal cost assignment approach for the ranked solution —	151
7.6	Concluding remarks —	153
	References —	153

Chapter 8

The travelling salesman problem: Sub-tour elimination approaches and algorithms — 155

8.1	Introduction —	155
8.2	Binary formulation of the TSP —	156
8.2.1	Sub-tour elimination constraints —	157
8.2.2	Some conceptual ideas and typical structure of the TSP model —	158
8.2.3	Changing model (8.5) from linear integer to quadratic convex program (QP) —	160
8.2.4	Convexity of $f(\bar{X})$ —	161
8.2.5	Complexity of convex quadratic programming —	162
8.2.6	Other considerations —	162
8.3	Construction of sub-tour elimination cuts —	163
8.4	Proposed algorithm —	164
8.4.1	Numerical illustration —	164
8.4.2	Conclusion —	166
8.5	The transshipment approach to the travelling salesman problem —	167
8.5.1	Conventional formulation —	167
8.5.2	Some important properties of a totally unimodular matrix —	167
8.5.3	Breaking a TSP into transshipment sub-problems —	168
8.5.4	General case – transshipment sub-problem —	169
8.5.5	Standard constraints —	170
8.5.6	Infeasibility —	171
8.6	The transshipment TSP linear integer model —	171
8.6.1	Numerical illustration —	172
8.6.2	The formulated transshipment TSP linear integer model —	172
8.7	Conclusions —	179
	References —	179
