Abstract	III
Kurzfassung	V
List of Acronyms	XI
1 Introduction	1
1.1 Applications and Challenges of Mobile and Vehicular Crowdsensing in Future Intelligent Transportation Systems	1
1.1.1 Mobile and Vehicular Crowdsensing Applications	3
1.1.2 Connected Vehicles and Vehicle-to-Cloud Communication	6
1.2 Challenges for Resource-Efficient Vehicle-to-Cloud Communication	7
1.3 Problem Statement and Requirement Analysis	9
1.4 Scientific Contributions and Research Methodology	11
1.5 Structure of the Thesis	14
2 Selected Technical Basics	19
2.1 Cellular Networking with Long Term Evolution	19
2.1.1 Resource Allocation and Adaptive Modulation and Coding	20
2.1.2 Client-Based Determination of Network Quality Indicators	22
2.1.3 Communication-Related Power Consumption of Mobile Devices	24
2.2 Properties of Radio Channels and Communication Protocols	24
2.3 Machine Learning for Mobile Communication Systems	26
2.3.1 Supervised Learning for Regression and Classification	26
2.3.2 Unsupervised Learning for Data Clustering	33
2.3.3 Reinforcement Learning for Autonomous Decision Making	33
2.3.4 Overview of Data Analysis Toolkits	34
3 Related Work	37
3.1 Anticipatory Mobile Networking	37
3.1.1 Machine Learning-Enabled Wireless Networks	38
3.1.2 Opportunistic Networking and Context-Aware Optimization	39
3.1.3 End-to-End Data Rate Prediction in Cellular Networks	41
3.1.4 End-Edge Intelligence and Resource-Constrained Embedded IoT Systems	44

3.2	Methodological Approaches for Modeling and Performance Analysis of Vehicular Communication Networks	46
4	Machine Learning-Based Data Rate Prediction for Vehicle-to-Cloud Communication	51
4.1	Introduction	51
4.2	Data Acquisition Methodology of the Real World Measurement Campaign	53
4.3	Statistical Analysis: Distribution of Context Indicators Within the Evaluation Scenarios	57
4.4	Correlation Analysis: Impact of the Context Indicators on the End-to-End Data Rate	62
4.5	Machine Learning-based Data Rate Prediction	67
4.6	Towards Predictive QoS: Forecasting the End-to-End Data Rate at Future Locations Along the Vehicular Trajectory	87
4.6.1	Prediction of Future Vehicle Locations	88
4.6.2	Maintaining Network Context Information With Radio Environmental Maps	89
5	Machine Learning-Enabled Opportunistic Vehicle-to-Cloud Communication	101
5.1	Introduction	101
5.2	Context-Aware Data Transfer Methods	105
5.2.1	Machine Learning CAT (ML-CAT)	107
5.2.2	Reinforcement Learning CAT (RL-CAT)	111
5.2.3	Black Spot-Aware Contextual Bandit (BS-CB)	117
5.3	Methodology of the Real World Performance Evaluation	125
5.4	Real World Performance of Machine Learning-Based Opportunistic Vehicle-to-Cloud Communication	128
5.5	Towards Context-Predictive Opportunistic Data Transfer	134
5.5.1	Context-Predictive Variants of the Probabilistic Transmission Schemes	136
5.5.2	Context-Predictive Variants of the Reinforcement Learning-Based Transmission Schemes	138
5.5.3	Real World Performance Evaluation of Context-Predictive Data Transfer Methods	138
6	Data-Driven Simulation and Optimization of Anticipatory Vehicular Communication Networks	143
6.1	Introduction	143
6.2	Data-Driven Simulation of End-to-End Network Performance Indicators	147
6.3	Lightweight Simulation of Vehicular Mobility with LIMoSim	151

6.4	Hybrid Data-Driven and Model-Based Vehicular Network Simulation	157
6.5	Validation Methodology	158
6.6	Validation and Performance Evaluation	160
6.7	Modeling Accuracy of DES- and DDNS-Based Methods	160
6.7.1	Computational Efficiency of the Simulation Methods	164
6.7.2	Limitations of Data-driven Network Simulation	165
7	Lightweight Machine Learning for End-Edge Intelligence-Enabled Communication Systems	169
7.1	Introduction	169
7.2	Core Concepts and Functions of the LIMITS Framework	172
7.2.1	Intuitive Interfaces for High-Level Data Analysis	173
7.2.2	Supported Machine Learning Models	174
7.2.3	Overview about Automation Features	175
7.2.4	Implementation of ANN-based Online Learning	179
7.3	Case Study: Platform-in-the-loop Model Selection for Data Rate Prediction with End-Edge Devices	180
7.3.1	Methodology: IoT Platforms, Data Sets, and Power Consumption Assessment Procedure	181
7.3.2	Sweet Spot Analysis: Model Performance and Memory Occupation	183
7.3.3	Temporal Efficiency and Power Consumption Behavior of Machine Learning Models	188
7.4	Validation of the C/C++ Code Generator	192
8	Evolution Perspectives and Transfer Opportunities	197
8.1	Towards Cooperative Data Rate Prediction in Future Networks	197
8.2	Online Learning for Self Adaptation to Concept Drift	201
8.3	Mining Signal Strength Information from Geographical Data	203
8.4	PARRoT: Predictive Ad-hoc Routing Fueled by Reinforcement Learning and Trajectory Knowledge	205
8.5	Migration of the Contributions to Future Network Generations	208
8.6	Additional Impulses for Further Research Activities	210
9	Conclusion	215
	Bibliography	221
