

Table of contents

1	Introduction	5
2	Current state of research and standardization	7
2.1	Published investigations.....	7
2.2	Current state of standardization	8
3	Objective of the investigation	9
3.1	Practical realization	9
3.2	Selecting the liquids	12
4	Gravimetric measurement apparatus.....	14
4.1	Theoretical fundamentals	14
4.2	Description of the gravimetric apparatus	16
4.3	Description of the dispensing process.....	19
4.4	Assessing the measurement curves	20
5	Fundamental investigations on evaporation.....	23
5.1	Evaporation from weighing vessels	23
5.2	Influence of evaporation on the temperature of the liquid in the reservoir and on the dispensing device	28
5.3	Change in the air density due to evaporating liquid.....	33
6	Measurement uncertainty budget for the measurement of a volume of liquid with the gravimetric measuring device	38
7	Comparing the dispensing of water, ethanol, and nonane	45
8	Comparing the dispensing of water and human serum	60
9	Possibility of replacing water as a calibration liquid	69
9.1	Stability of serum	69
9.2	Control material as a replacement liquid for serum	73
10	Density of human serum	78
10.1	Serum density at 20 °C.....	78
10.2	Temperature dependence of the serum density	86
11	Reproducibility of dispensing results.....	89
12	Alternative volume determination method: photometry	96
12.1	Physical fundamentals of photometry	96
12.2	Producing the contrast agent solutions to calibrate volumetric dispensing devices ..	99
12.3	Photometric calibration of two pipettes	102
12.4	Advantages and disadvantages of the photometric calibration of volumetric dispensing devices.....	108
13	Summary	110
	List of Figures	114
	Literature	119
	Annex 1	121
