**Preface — V**

**Acknowledgements — VII**

**List of Tables — XIII**

**List of Figures — XV**

**Frequently used acronyms — XVII**

**1 Introduction — 1**

- 1.1 Overview and motivations — 1**
- 1.2 Remarks on experiments and their role in gaining valuable knowledge — 3**
- 1.3 Experiments for parameter estimation and model building methodology — 4**
- 1.4 Our limitations — 6**
- 1.5 We need new paradigms — 7**
- 1.6 Bibliographical notes — 9**
- 1.7 Notational conventions — 13**

**2 Optimal experiment design for linear regression models – a primer — 17**

- 2.1 The basic linear model — 17**
- 2.2 The LSM – some basic facts on its accuracy — 20**
- 2.3 Toward design optimality criteria — 25**
- 2.4 Approximate experiment designs — 29**
- 2.5 Optimality conditions – the Kiefer and Wolfowitz theorem — 34**
- 2.6 Case studies – sensor allocation — 39**
- 2.7 Why the D-optimality criterion? — 43**
- 2.8 Remarks on optimal experiment designs for nonlinear models — 44**

**3 Numerical search for D-optimal designs – basic methods for a linear regression — 49**

- 3.1 Introductory considerations — 49**
- 3.2 Optimal allocation of observations — 50**
- 3.2.1 Why is the multiplicative weights update algorithm so fast? — 55**
- 3.3 The algorithm of Wynn and Fedorov — 56**
- 3.4 The combined algorithm — 64**

<b>4</b>	<b>The product of experiment designs and its optimality — 69</b>
4.1	The product of designs — 69
4.2	Multiplicative models — 70
4.3	On the D-optimality of product designs for estimating multiplicative models — 72
4.4	Examples — 76
<b>5</b>	<b>Optimal input signals for linear systems described by ODEs — 79</b>
5.1	Remarks on parameter estimation of systems described by ODEs — 79
5.2	LTI systems – the frequency domain approach — 81
5.3	Optimal input signals for ODE systems – the time domain approach — 94
5.4	Safer input signals – time domain synthesis — 103
<b>6</b>	<b>Optimal excitations for systems described by elliptic equations — 105</b>
6.1	Introduction and notational conventions — 105
6.2	Systems described by elliptic equations — 105
6.3	Spectra of compact linear operators — 109
6.4	Integral operators — 110
6.5	Green's functions of elliptic operators — 113
6.6	The dependence of Green's function on the parameters of elliptic operators — 116
6.7	A special class of Green's functions — 118
6.8	Eigenfunctions of operators of the elliptic type – more examples — 120
6.9	Problem statement and D-optimality conditions for systems described by elliptic PDEs — 124
6.10	A more exact characterization of the solution — 126
<b>7</b>	<b>Optimal input signals for DPS – time domain synthesis — 133</b>
7.1	Introduction and notational conventions — 133
7.2	Assumptions on parabolic and hyperbolic PDEs — 133
7.3	Assumptions on observations and the form of the Fisher information matrix — 137
7.4	Spatio-temporal structure of the solution — 142
7.5	Safer input signals for DPS — 148
<b>8</b>	<b>Input signal design for systems with spatio-temporal dynamics – frequency domain approach — 151</b>
8.1	Introduction and notational conventions — 151
8.2	Assumptions — 151
8.3	Problem statement — 152

8.4	The equivalence theorem for input signals – the space-frequency domain approach — 157
8.5	The structure of the D-optimal input signal — 158
8.6	Insight into the structure of $S_u^*$ and examples — 161
<b>9</b>	<b>Final comments — 165</b>
9.1	Suppositions about extending the possible applicability of the results — 165
9.2	What is left outside this book and open problems — 167
9.3	Concluding remarks — 169
<b>Bibliography — 171</b>	
<b>Index — 181</b>
