

Contents

1	Introduction	1
1.1	Great concepts of the microcosm	1
1.1.1	Atoms	1
1.1.2	Elementary particles	1
1.1.3	Elementary interactions	2
1.1.3.1	The essential source of electromagnetism . .	2
1.1.4	Electroweak unification	3
1.1.5	Quantum physics	3
1.2	Great cosmic concepts	3
1.2.1	Heavenly objects move according to gravity	3
1.2.2	Equivalence principle	4
1.2.3	Space and time evolve according to relativity	5
1.2.4	Vacuum	6
1.2.5	Spacetime quadruple, SQ	7
1.2.6	Organization of the book	8
2	Basic Theory	9
2.1	Introduction of SQ	10
2.1.1	Principles of free fall	10
2.1.1.1	Galileo's equivalence principle, GEP	10
2.1.1.2	Einstein equivalence principle, EEP	11
2.1.1.3	Principle of energy conservation at free fall .	12
2.1.1.4	Summarized principles of free fall, PFF . . .	12
2.1.2	On Gaussian gravity	12
2.1.2.1	Field G^* as a function of the radial coordi- nate r	14
2.1.2.2	Local measurements in curved spacetime . .	15
2.1.3	On special relativity	16
2.1.3.1	SR fully based on a thought experiment . .	17
2.1.4	On general relativity	18
2.1.4.1	General relativity is mesoscopic	18
2.1.5	Formed vacuum	18

2.1.6	Thought experiment on formed vacuum	20
2.1.7	Spacetime-quadruple, SQ	20
2.1.8	On the structure of time	20
2.2	Each mass forms vacuum	24
2.3	Rate gravity wave, RGW	25
2.3.1	Elongations	25
2.3.2	Change tensor	26
2.3.3	Change of volume	28
2.3.4	Dynamics of formed vacuum	30
2.3.5	Waves of formed vacuum	31
2.3.5.1	Solutions in the vacuum	31
2.3.5.2	DEQ for stationary fields	32
2.4	SQ explains QP and QG	34
2.4.1	Quantization derived	35
2.4.2	Universality of Planck's constant derived	36
2.4.3	Schrödinger equation derived	37
2.4.4	Objects with $v_{prop} < c$	39
2.5	Mass forms via QG	41
2.5.1	Gravity can fold vacuum	41
2.5.2	Cosmic unfolding	44
2.5.3	Availability of quanta of cosmic unfolding	45
2.6	Charge forms via QG	48
3	Explanation of Traditional Theories	49
3.1	Principle of Least Action, PLA, in QP	49
3.1.1	Semiclassical path $\vec{x}(t)$	50
3.1.2	Fermat's Minimum Principle	50
3.1.2.1	Reflection	50
3.1.2.2	Refraction: Fermat's Minimum Principle	51
3.1.2.3	Proof of Fermat's Minimum Principle	51
3.1.3	Application of Fermat's Principle to QP	52
3.1.4	Lagrangian	53
3.2	Principle of Gauge Invariance, PGI	53
3.3	SMEP	56
3.3.1	β -decay	56
3.3.2	Isospin - pairs	56
3.3.3	Isospin	57
3.3.4	Generations	57
3.3.5	Two additional symmetries	58
3.3.6	Mixing	59
3.4	SMEWI	59
3.4.1	Explanation of two couplings	60

3.4.2	Explanation of the $SU(2)$ -group of isospin	60
3.4.3	Traditional description	61
3.4.4	Electromagnetic and weak interaction	62
3.4.4.1	Strength of source and of interaction	62
3.4.4.2	Effect of an interaction	63
3.4.4.3	Charge g of the isospin interaction	64
3.4.4.4	Charge g' of the hypercharge interaction	64
3.4.5	Lagrangian	64
3.4.5.1	Free Lagrangian	64
3.4.5.2	Lagrangian in QED	65
3.4.5.3	Structure of the electroweak interaction	65
3.5	Units used in the SMEWI	66
4	Aim	69
4.1	Open questions in SMEP and SMEWI	69
5	Formation of hypercharge	71
5.1	Structure of electric charge $\tilde{e}$	71
5.1.1	The component $\kappa_{emitted,\perp,+}$ of $\tilde{e}$	72
5.1.2	Calculation of the angle Θ	73
5.1.3	Perturbation theory for α	74
5.1.4	Amount of perturbations	76
5.1.5	Application of perturbations	77
5.1.6	Comparison of Θ with the weak angle Θ_W	77
6	Formation of isospin	79
6.1	Components q_e and q_Z of hypercharge	79
6.2	Linear independence of hypercharge and isospin	79
6.3	Coordinates corresponding to g_{HC} and g_I	81
7	Derivation of the Lagrangian	85
7.1	PLA and Free Lagrangian	85
7.2	Principle of Gauge Invariance, PGI	87
7.3	SMEWI based on Gauge Group $SU(2)$	91
7.4	Isospin doublets based on SQ	92
8	Derivation of the masses	95
8.1	Lagrangian of electroweak interaction	95
8.1.1	Free Lagrangian $\mathcal{L}_0$	95
8.1.2	On symmetries in the weak interaction	95
8.1.3	Lagrangian $\mathcal{L}$ via PGI	97
8.2	Incompleteness of the PGI	98
8.3	Solution by phase transition, PT	98

8.4	PT by Higgs mechanism	99
8.4.1	SMEP scalar potential	99
8.4.2	SMEP Higgs Lagrangian	99
8.4.2.1	Symmetric phase	100
8.4.2.2	Phase with broken symmetry	100
8.5	Higgs vacuum $VEV \neq$ actual vacuum	101
8.6	Unspecific PT of the Higgs mechanism	102
8.7	Solution via PT based on SQ	102
8.7.1	Observation of Higgs boson pairs	104
8.7.2	Symmetry breaking of vacuum based on the SQ	104
8.7.2.1	Wave function	104
8.7.3	Lagrangian derived by SQ	105
8.7.3.1	Potential in $\mathcal{L}$	105
8.8	Derivation of the masses m_W and m_Z	106
8.9	Explanation of parity violation	114
9	Derivation of GR	115
9.1	Smooth transformations	115
9.2	Derivations based on the PLA or PSA	116
9.2.1	Paths	116
9.2.2	Action	117
9.2.3	Gauge invariance	117
9.3	EFE derived from the SQ	118
9.4	First incompleteness of GR	127
9.5	Second incompleteness of GR	127
9.6	Third incompleteness of GR	128
9.7	Solution of 3 rd incompleteness of GR	130
10	Discussion	133
10.1	Results	133
10.2	Local derivation of global space	137
10.3	Derivation of the spectrum of vacuum	138
10.4	Explanation of units in SMEWI	140
10.5	Outlook	141
11	Appendix	143
11.1	Universal constants	143
11.2	Natural units	145
11.3	Observed macroscopic values	146
11.4	Observed microscopic values	147
11.5	Glossary	148
