1	Introduction	1
1.1	Physiology of the larynx and mechanics of phonation	3
1.1.1	Function and anatomy of the human larynx	3
1.1.2	Physiology and dynamics of phonation	6
1.1.3	Geometry and physical parameters	8
1.2	Physical basics of the human voice	10
1.2.1	Fluid dynamics	10
1.2.2	Structural dynamics	14
1.2.3	Acoustics	14
1.2.4	Fluid-Structure-Acoustic-Interaction	18
1.3	State of the art: Numerical larynx models	19
1.3.1	Reduced-Order VF models	20
1.3.2	Continuum based models	22
1.4	Motivation	24
1.5	Thesis structure	26
2	The hybrid numerical larynx model - <i>simVoice</i>	27
2.1	Geometric dimensions	27
2.2	Mimicking glottis insufficiency	33
2.3	Vocal fold oscillation	35
2.3.1	Adapting the GAW to the GC types	37
2.3.2	Asymmetric vocal fold oscillation	38
2.3.3	Periodic and aperiodic vocal fold motion	41
2.3.4	Individual <i>in vivo</i> and <i>ex vivo</i> vocal fold dynamics	45
2.4	Computational fluid dynamics (CFD)	48
2.4.1	Turbulence modeling	48
2.4.2	Numerical methods	50

2.5	Computational aero-acoustic (CAA)	55
2.5.1	Perturbed convective wave equation (PCWE)	55
2.5.2	Boundary conditions	56
2.6	Data acquisition	58
2.7	Setup of <i>simVoice</i> - Summary	60
3	Evaluation of model validity	61
3.1	Mesh independence studies	61
3.1.1	Rectangular vocal tract (validation case)	62
3.1.2	Smoothed /a/ - vocal tract	64
3.1.3	<i>Ex vivo</i> free-field configuration	65
3.2	Validation against experimental model	67
3.3	Mesh studies and validation - Summary	70
4	Investigation of glottal insufficiency and asymmetric vocal fold oscillations	73
4.1	Aerodynamic characteristics	74
4.1.1	Volume flow rate	74
4.1.2	Glottis resistance	76
4.1.3	Energy transfer	76
4.1.4	Flow field structure	78
4.2	Quality of acoustic voice signal	80
4.2.1	Spectral analysis and formant frequencies	80
4.2.2	Sound pressure level (SPL) and vocal efficiency (VE)	80
4.2.3	Cepstral Peak Prominence (CPP)	82
4.3	Impact of the glottal insufficiency and asymmetric oscillations - Summary	84
5	Parameter study on functional voice disorders	87
5.1	Aerodynamic characteristics	89
5.1.1	Volume Flow	89
5.1.2	Glottis resistance	91
5.1.3	Energy transfer	93
5.2	Quality of acoustic voice signal	96
5.2.1	Spectral analysis	96
5.2.2	Sound pressure level (SPL)	99
5.2.3	Cepstral Peak Prominence (CPP)	101
5.3	Parameter study - Summary	103

6	Transferring realistic vocal fold dynamics to <i>simVoice</i>	105
6.1	Modeling quality	107
6.1.1	Fundamental Frequency	107
6.1.2	Glottal dynamic characteristics: Closing Quotient (CQ) and Speed Quotient (SQ)	108
6.2	Aerodynamic characteristics	108
6.2.1	Volume Flow	109
6.2.2	Glottis Resistance	111
6.3	Acoustic characteristics	111
6.3.1	Fundamental frequency	111
6.3.2	Spectral analysis	112
6.3.3	Sound pressure level (SPL) and vocal efficiency (VE)	117
6.3.4	Cepstral Peak Prominence (CPP) and Harmonic-to-Noise Ratio (HNR)	118
6.4	Mimicking realistic vocal fold dynamics - Summary	119
7	Conclusion and Outlook	121
7.1	Conclusion	121
7.2	Limitations	123
7.3	Future perspectives of the <i>simVoice</i> project	123
	Bibliography	126
A	Further information on the setup of the <i>simVoice</i> model	153
B	Detailed computation of the used parameters and characteristics	155
C	Further results	159
	List of Figures	167
	List of Tables	182
