

Contents

1	Computing Integrals	1
1.1	Background	1
1.2	The Computational Problem	3
1.3	The Trapezoidal Method	4
1.3.1	Approximating the Integral Using One Trapezoid	5
1.3.2	Approximating the Integral Using Two Trapezoids	7
1.3.3	Approximating the Integral Using n Trapezoids	9
1.4	Computational Analysis	12
1.5	Back to the Bagels	14
1.6	Exercises	15
1.7	Projects	17
1.7.1	Show that the Error is $O(h^2)$	17
1.7.2	Derive Other Methods for Numerical Integration	22
1.7.3	Compute the Length of a Cable	26
2	Differential Equations: The First Steps	31
2.1	Modeling Changes	31
2.1.1	The Cultivation of Rabbits	32
2.1.2	The Simplest Possible Case	32
2.1.3	Exponential Growth	33
2.1.4	Logistic Growth	37
2.2	Numerical Solution	40
2.2.1	The Simplest Possible Model	41
2.2.2	Numerical Approximation of Exponential Growth	44
2.2.3	Numerical Stability	46
2.2.4	An Implicit Scheme	48
2.2.5	Explicit and Implicit Schemes	49
2.2.6	Numerical Solution of the Logistic Equation	55
2.3	Exercises	60
2.4	Projects	67
2.4.1	More on Stability	67
2.4.2	More on Accuracy	69

3	Systems of Ordinary Differential Equations	75
3.1	Rabbits and Foxes; Fish and Sharks	75
3.2	A Numerical Method: Unlimited Resources	78
3.3	A Numerical Method: Limited Resources	79
3.4	Phase Plane Analysis	80
3.4.1	A Simplified Model	80
3.4.2	The Phase Plane	81
3.4.3	Circles in the Analytical Phase Plane	83
3.4.4	Alternative Analysis	84
3.4.5	Circles in the Numerical Phase Plane	85
3.4.6	More on Numerics	88
3.5	Exercises	91
3.6	Project: Analysis of a Simple System	95
4	Nonlinear Algebraic Equations	99
4.1	The Bisection Method	102
4.2	Efficiency Consideration	106
4.3	Newton's Method	107
4.4	The Secant Method	112
4.5	Fixed-Point Iterations	115
4.5.1	Convergence of Fixed-Point Iterations	117
4.5.2	Speed of Convergence	120
4.5.3	Existence and Uniqueness of a Solution	121
4.5.4	Uniqueness	122
4.5.5	Existence	123
4.6	Systems of Nonlinear Equations	125
4.6.1	A Linear System	126
4.6.2	A Nonlinear System	127
4.6.3	Newton's Method	129
4.6.4	A Nonlinear Example	132
4.6.5	The Nonlinear System Revisited	133
4.7	Exercises	134
4.8	Project: Convergence of Newton's Method	138
5	The Method of Least Squares	147
5.1	Building Models of Discrete Data Sets	150
5.1.1	Approximation by a Constant	150
5.1.2	Approximation by a Linear Function	154
5.1.3	Approximation by a Quadratic Function	157
5.1.4	Large Data Sets	161
5.2	Application to Population Models	165
5.2.1	Exponential Growth of the World Population?	166
5.2.2	Logistic Growth of the World Population	170
5.3	Least Squares Approximations of Functions	173
5.3.1	Approximating Functions by a Constant	176

5.3.2	Approximation Using Linear Functions	178
5.3.3	Approximation Using Quadratic Functions	180
5.3.4	Summary of the Examples	183
5.4	Exercises	185
5.5	Project: Computing Coefficients.....	190
6	About Scientific Software	195
6.1	Algorithms Expressed as Pseudo Code	197
6.1.1	Basic Ingredients of Pseudo Codes	197
6.1.2	Integration.....	199
6.1.3	Optimization of Algorithms and Implementations.....	200
6.1.4	Developing Algorithms for Simpson's Rule	203
6.1.5	Adaptive Integration Rules	207
6.1.6	Ordinary Differential Equations	211
6.2	About Programming Languages	212
6.2.1	Static Typing Versus Dynamic Typing	213
6.2.2	Computational Efficiency	214
6.2.3	Built-in High-Performance Utilities	215
6.2.4	Support for User-Defined Objects	216
6.3	The Trapezoidal Rule in Different Languages	217
6.3.1	Code Structure	217
6.3.2	Fortran 77	218
6.3.3	C and C++	222
6.3.4	Java	224
6.3.5	Matlab	226
6.3.6	Python	228
6.3.7	Vectorization	230
6.3.8	Maple.....	236
6.3.9	Summary	237
6.4	Heun's Scheme in Different Languages	239
6.4.1	Code Structure	239
6.4.2	Fortran 77	239
6.4.3	Graphics.....	242
6.4.4	C++	244
6.4.5	Java	248
6.4.6	Matlab	249
6.4.7	Python	251
6.4.8	Summary	252
6.5	Numerical Software Engineering	254
6.5.1	Function Libraries	254
6.5.2	Motivation for Object-Oriented Libraries	259
6.5.3	Design of a Numerical Integration Hierarchy	262
6.5.4	A Class Hierarchy in Java	263
6.5.5	A Class Hierarchy in Python	265
6.5.6	Object-Oriented Programming in Matlab	268

6.6	Exercises	269
6.7	Projects	270
6.7.1	Computing the Volume of a Cylindrical Container	270
6.7.2	A Class Hierarchy for Scalar ODE Solvers	271
6.7.3	Software for Systems of ODEs	272
7	The Diffusion Equation	273
7.1	Basics of Diffusion Processes	274
7.1.1	Heat Conduction	274
7.1.2	Diffusive Transport of a Substance	275
7.1.3	Diffusion Versus Convection	276
7.1.4	The Relevance of One-Dimensional Models	277
7.2	The Mathematical Model of Diffusion	285
7.2.1	The Diffusion Equation	285
7.2.2	Initial and Boundary Conditions	286
7.2.3	The One-Dimensional Initial-Boundary Value Problem	287
7.2.4	The Three-Dimensional Diffusion Equation	287
7.3	Derivation of Diffusion Equations	290
7.3.1	Diffusion of a Substance	290
7.3.2	Heat Conduction	295
7.3.3	Viscous Fluid Flow	300
7.3.4	Summarizing the Models	304
7.3.5	Scaling	307
7.4	Explicit Numerical Methods	316
7.4.1	The Basics of Finite Difference Discretizations	316
7.4.2	Incorporating Dirichlet Boundary Conditions	321
7.4.3	Incorporating Neumann Boundary Conditions	321
7.4.4	How to Verify a Computer Implementation	324
7.4.5	Instability	327
7.4.6	A Discrete Algorithm Directly from Physics	332
7.4.7	Variable Coefficients	334
7.5	Implicit Numerical Methods	336
7.5.1	The Backward Euler Scheme	336
7.5.2	The Linear System of Equations	337
7.5.3	Solution of Tridiagonal Linear Systems	340
7.5.4	Comparing the Explicit and Implicit Methods	342
7.5.5	The Crank–Nicolson Scheme	344
7.5.6	The θ Scheme	346
7.6	Exercises	348
7.7	Projects	352
7.7.1	Diffusion of a Jump	352
7.7.2	Periodical Injection of Pollution	353
7.7.3	Analyzing Discrete Solutions	355
7.7.4	Compare Different Scalings	356

8	Analysis of the Diffusion Equation	359
8.1	Properties of the Solution	360
8.1.1	Energy Arguments	360
8.1.2	A Bound on the Derivative	362
8.1.3	Stability	364
8.1.4	Uniqueness	366
8.1.5	Maximum Principles	366
8.1.6	Physical Considerations	367
8.1.7	Analytical Considerations	367
8.1.8	The Minimum Principle	372
8.1.9	Summary	373
8.1.10	Uniqueness Revisited	374
8.2	Separation of Variables and Fourier Analysis	374
8.2.1	Separation of Variables	375
8.2.2	Super-Positioning	378
8.2.3	Fourier Series and the Initial Condition	381
8.2.4	Some Simple Examples	381
8.2.5	Initial Conditions Given by a Sum of Sine Functions	382
8.2.6	Computing Fourier Sine Series	384
8.2.7	Summary	386
8.2.8	More Examples	387
8.2.9	Analysis of an Explicit Finite Difference Scheme	392
8.2.10	Consequences of the Stability Criterion	395
8.2.11	Exercises	396
8.3	Projects	403
8.3.1	Neumann Boundary Conditions	403
8.3.2	Variable Coefficients	406
9	Parameter Estimation and Inverse Problems	411
9.1	Parameter Estimation in Exponential Growth	412
9.1.1	A Simpler Problem	414
9.2	The Backward Diffusion Equation	415
9.3	Estimating the Diffusion Coefficient	418
9.4	Exercises	419
10	A Glimpse of Parallel Computing	423
10.1	Motivations for Parallel Computing	423
10.1.1	From the Perspective of Speed	423
10.1.2	From the Perspective of Memory	426
10.1.3	Parallel Computers	426
10.2	More About Parallel Computing	427
10.2.1	Inspirations from Parallel Processing in Real Life	428
10.2.2	From Serial Computing to Parallel Computing	428
10.2.3	Example 1 of Data Parallelism	430
10.2.4	Example 2 of Data Parallelism	432

10.2.5	Example 3 of Data Parallelism	434
10.2.6	Performance Analysis	438
10.2.7	Overhead Related to Parallelization	440
10.3	Parallel Programming	442
10.3.1	OpenMP Programming	443
10.3.2	MPI Programming	445
10.3.3	Concluding Remarks	449
10.4	Exercises	449
10.5	Project: Parallel Solution of a 2D Diffusion Equation.....	451
