Preface to the English edition — VII

Preface — XI

List of notation — XXVII

## **1 Abstract canonical operator and symplectic geometry — 1**

**1.1 Introduction — 1**

**1.1.1 Construction of approximate solutions of various equations: comparison of methods — 1**

**1.1.2 Abstract canonical operator and geometry of the phase space — 5**

**1.1.3 Problem of existence of equations of motion and the concept of asymptotic quantization — 8**

**1.2 Abstract canonical operator and induced geometric structures on the phase space — 9**

**1.2.1 Auxiliary notions — 9**

**1.2.2 Definition of an abstract canonical operator — 11**

**1.2.3 Well-definedness of the canonical operator—the action 1-form on the phase space — 12**

**1.2.4 Operator-valued 1-form induced by the canonical operator — 16**

**1.2.5 Canonical transformation of the abstract canonical operator — 18**

**1.2.6 Canonical and proper canonical transformations of the phase space — 21**

**1.2.7 Formal asymptotic solutions of the equations of motion — 21**

**1.3 Abstract complex germ and construction of formal asymptotic solutions of the equations of motion — 22**

**1.3.1 Definition of complex germ — 22**

**1.3.2 Properties of the abstract complex germ — 24**

**1.3.3 Canonical transformation of the abstract complex germ — 26**

**1.3.4 Canonical operator corresponding to a complex germ — 28**

**1.4 Asymptotics of the solution of the Cauchy problem — 30**

**1.4.1 Canonical transformations of the canonical operator and construction of asymptotics of the solution of the Cauchy problem — 30**

**1.4.2 Asymptotics of the solution of the Cauchy problem modulo  $O(\epsilon^{M/2})$  — 33**

**1.5 Theory of complex germ at a point in finite-dimensional quantum mechanics — 35**

**1.5.1 Definition of the canonical operator and checking the axioms — 35**

**1.5.2 Canonical and proper canonical transformations of the phase space — 36**

|          |                                                                                                                |
|----------|----------------------------------------------------------------------------------------------------------------|
| 1.5.3    | Complex germ — 37                                                                                              |
| 1.5.4    | Canonical transformations depending on time — 42                                                               |
| 1.5.5    | Commutation of the canonical operator with the Hamiltonian and proof of the asymptotic formula — 45            |
| 1.A      | Classical and quantum mechanics: the main definitions [1, 20, 53] — 52                                         |
| 1.B      | Some recollections from differential geometry — 54                                                             |
| 1.B.1    | Smooth mappings of Hilbert spaces — 54                                                                         |
| 1.B.2    | Smooth manifolds and differential forms — 55                                                                   |
| 1.B.3    | Universal covering, homology, and cohomology — 58                                                              |
| <b>2</b> | <b>Multiparticle canonical operator and its properties — 61</b>                                                |
| 2.1      | Introduction — 61                                                                                              |
| 2.1.1    | Physical problems giving rise to the study of functions of large number of arguments — 61                      |
| 2.1.2    | Physical arguments leading to the choice of a norm in the space of functions of large number of arguments — 62 |
| 2.1.3    | Method of BBGKY hierarchies — 64                                                                               |
| 2.1.4    | Nonconservation of chaos for $N$ -particle wave function: statement of the theorem — 66                        |
| 2.1.5    | Asymptotics of the solution of the Cauchy problem: statement of the theorem — 68                               |
| 2.2      | Definition of multiparticle canonical operator — 73                                                            |
| 2.2.1    | Examples of multiparticle functions satisfying the chaos property — 73                                         |
| 2.2.2    | Definition and simplest properties of the multiparticle canonical operator — 74                                |
| 2.3      | Geometric structures on the one-particle space induced by the multiparticle canonical operator — 76            |
| 2.4      | Canonical and proper canonical transformations of the manifold $\mathcal{M}$ — 83                              |
| 2.4.1    | Canonical transformations of the phase space and their properties — 83                                         |
| 2.4.2    | Proper canonical transformations — 87                                                                          |
| 2.5      | Complex germ — 89                                                                                              |
| 2.5.1    | Complex germ corresponding to a Gaussian vector — 89                                                           |
| 2.5.2    | Canonical transformation of a complex germ — 94                                                                |
| 2.5.3    | Construction of the operator $W$ — 95                                                                          |
| 2.6      | Formal asymptotic solutions of the equations of motion — 97                                                    |
| 2.6.1    | Some examples of formal asymptotic solutions and the problem of conservation of chaos — 97                     |
| 2.6.2    | Invariant formal asymptotic solutions — 100                                                                    |

|          |                                                                                                                                                     |
|----------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| 2.6.3    | Equations for a canonical transformation and a complex germ depending on time — 102                                                                 |
| 2.6.4    | Equations for the operator $W$ — 104                                                                                                                |
| 2.6.5    | Formal asymptotic solution satisfying a given initial condition — 108                                                                               |
| 2.7      | Commutation of the canonical operator with the Hamiltonian and the main theorem — 112                                                               |
| 2.7.1    | Commutation of the canonical operator with other operators — 112                                                                                    |
| 2.7.2    | Asymptotics of the solution of the Cauchy problem — 119                                                                                             |
| 2.A      | Method of second quantization [6] — 120                                                                                                             |
| 2.A.1    | Fock space and creation and annihilation operators — 120                                                                                            |
| 2.A.2    | Coherent states and their properties — 123                                                                                                          |
| 2.A.3    | Generating functionals — 123                                                                                                                        |
| 2.A.4    | Norm of a Gaussian vector — 125                                                                                                                     |
| 2.A.5    | Linear canonical transformations — 127                                                                                                              |
| 2.B      | Some properties of the unit sphere in the space $L^2$ — 129                                                                                         |
| 2.C      | Proof of existence of the solutions of some equations — 133                                                                                         |
| <b>3</b> | <b>Asymptotic solutions of the many-body problem — 139</b>                                                                                          |
| 3.1      | Introduction — 139                                                                                                                                  |
| 3.1.1    | Various physical applications of the method — 139                                                                                                   |
| 3.1.2    | Probability density distribution: the choice of a norm — 143                                                                                        |
| 3.1.3    | Half-density function and applicability of the method in Chapter 2 — 146                                                                            |
| 3.1.4    | Chaos conservation problem in systems of many classical particles — 148                                                                             |
| 3.2      | Asymptotic formulas for the multiparticle density matrix — 149                                                                                      |
| 3.2.1    | Choice of a norm on the space of density matrices — 149                                                                                             |
| 3.2.2    | Half-density matrix and its properties — 150                                                                                                        |
| 3.2.3    | Asymptotic solutions of the equation for the half-density matrix — 152                                                                              |
| 3.2.4    | Representation via the germ creation and annihilation operators — 154                                                                               |
| 3.2.5    | Hermitian property of the half-density matrix — 156                                                                                                 |
| 3.2.6    | Half-density matrix for pure states — 156                                                                                                           |
| 3.2.7    | Existence of solutions of certain auxiliary equations and asymptotics of solution of the Cauchy problem for the multiparticle Wigner equation — 158 |
| 3.3      | Asymptotic solutions of the $N$ -particle Schrödinger equation as $N \rightarrow \infty$ and superfluidity — 161                                    |
| 3.3.1    | Asymptotic solutions of the $N$ -particle Schrödinger equation — 161                                                                                |
| 3.3.2    | N. N. Bogoliubov's superfluidity theory — 166                                                                                                       |
| 3.3.3    | Generalization of the notion of superfluidity — 168                                                                                                 |
| 3.4      | Asymptotics of solution of the $N$ -particle Liouville equation and violation of the chaos conjecture for density function — 169                    |

|        |                                                                                                                               |            |
|--------|-------------------------------------------------------------------------------------------------------------------------------|------------|
| 3.4.1  | Existence of solutions of the Vlasov and Riccati equations —                                                                  | 169        |
| 3.4.2  | Asymptotics of solution of the Cauchy problem for the $N$ -particle Liouville equation —                                      | 174        |
| 3.4.3  | Stationary asymptotic solutions of the many-body problem —                                                                    | 175        |
| 3.5    | Asymptotic solutions of the equation corresponding to the uniformization of a functional on an abstract Hamiltonian algebra — | 177        |
| 3.5.1  | Definition of abstract Hamiltonian algebra —                                                                                  | 178        |
| 3.5.2  | Abstract half-density —                                                                                                       | 181        |
| 3.5.3  | Tensor products of Hamiltonian algebras and of their representations. The notion of uniformization —                          | 183        |
| 3.5.4  | Construction of asymptotics of solution of the Cauchy problem —                                                               | 186        |
| 3.A    | Existence of solutions of the Hartree and Riccati equations —                                                                 | 188        |
| 3.A.1  | Existence and uniqueness of solutions of a Hartree-type equation —                                                            | 188        |
| 3.A.2  | Existence of solutions of the variational equation and the Riccati equation —                                                 | 189        |
| 4      | <b>Complex germ method in the Fock space —</b>                                                                                | <b>193</b> |
