## Introduction to editor-in-chief Jie Zhang — V

Wuming Liu, Xiaopei Zhang, Wei Wu, Yaohua Chen

### 1 Cold atoms physics — 1

- 1.1 Cold atoms in magneto-optical trap — 1
  - 1.1.1 Introduction — 1
  - 1.1.2 BEC dynamics of the cold atoms in the time-dependent harmonic potential — 6
  - 1.1.3 Two-component cold atom BEC dynamics — 17
  - 1.1.4 BEC dynamics of cold atoms in 2D harmonic potential — 43
  - 1.1.5 Conclusions — 62
- 1.2 Cold atoms in optical lattices — 63
  - 1.2.1 Quantum phase transition — 63
  - 1.2.2 Optical lattice — 71
  - 1.2.3 Quantum phase transitions of cold atoms in triangular optical lattices — 82
  - 1.2.4 Quantum phase transitions of cold atoms in hexagonal optical lattice — 93
  - 1.2.5 Quantum phase transition of cold atoms in hexagonal optical lattice and gauge field — 100
  - 1.2.6 Quantum phase transitions of cold atoms in triangular Kagome lattice — 115
  - 1.2.7 Brief summary — 124
  - References — 125

Jianping Yin

### 2 Cold molecular physics — 139

- 2.1 Scientific research significance of cold molecules and applied prospects — 139
- 2.2 Fundamental researches on cold molecule physics and their recent development — 143
  - 2.2.1 Introduction — 143
  - 2.2.2 Cold collisions, few-body physics, and cold chemical physics — 144
  - 2.2.3 Precision measurement physics and invariance of time reversal — 149
  - 2.2.4 Bose–Einstein condensation (BEC) and Fermi quantum degeneracy of gaseous molecules — 153
  - 2.2.5 Quantum dipolar gases and dipole–dipole interactions — 156
  - 2.2.6 Alignment and orientation of cold molecules — 158
  - 2.2.7 Pendular state spectroscopy and its potential applications — 166

|       |                                                                                      |
|-------|--------------------------------------------------------------------------------------|
| 2.3   | Applications of the cold molecule technology and its recent development — <b>172</b> |
| 2.3.1 | Introduction — <b>172</b>                                                            |
| 2.3.2 | Molecular interferometers and their applications — <b>173</b>                        |
| 2.3.3 | Cold molecular spectroscopy and precision spectroscopy measurement — <b>183</b>      |
| 2.3.4 | Quantum information science and quantum simulations — <b>187</b>                     |
| 2.3.5 | Integrated molecule optics and molecule chips — <b>189</b>                           |
| 2.3.6 | Cold molecule lithography and preparation of new nanomaterials — <b>204</b>          |
| 2.4   | Experimental production of cold (or ultracold) molecules and outlook — <b>207</b>    |
| 2.4.1 | Methods and techniques for production of cold molecules — <b>207</b>                 |
| 2.4.2 | Outlook and summary — <b>210</b>                                                     |
|       | References — <b>211</b>                                                              |

| <b>4</b> | <b>Precision measurement based on atomic, molecular, and optical physics — 279</b> |
| 4.1      | Introduction — 279                                                                 |
| 4.2      | Basic experimental techniques in AMO physics — 281                                 |
| 4.2.1    | Ion trap — 281                                                                     |
| 4.2.2    | Magneto-optical trap and single-atom optical trap — 282                            |
| 4.2.3    | Atom interferometer — 292                                                          |
| 4.2.4    | Laser frequency stabilization — 297                                                |
| 4.3      | Precision measurement based on AMO physics — 307                                   |
| 4.3.1    | Precision spectra of atoms and molecules — 308                                     |
| 4.3.2    | The new standard for mass unit — 316                                               |
| 4.3.3    | Precision measurement of weak forces — 317                                         |
| 4.3.4    | Measurement of EDM — 318                                                           |
| 4.3.5    | Measurement of basic nucleus parameters — 320                                      |
| 4.3.6    | Precision measurements of time and frequency — 323                                 |
| 4.3.7    | Precision measurement of fundamental physics constants — 328                       |
| 4.3.8    | High-precision test of fundamental physics laws — 334                              |
| 4.3.9    | Gravitational wave detection — 338                                                 |
| 4.4      | The application of precision measurement technology — 341                          |
| 4.4.1    | Ion trap mass spectrometer — 341                                                   |
| 4.4.2    | Atom gravimeter — 342                                                              |
| 4.4.3    | Atom gravity gradiometer — 346                                                     |
| 4.4.4    | Atom gyroscope — 347                                                               |
| 4.4.5    | Atom magnetometer — 354                                                            |
| 4.4.6    | Atom frequency standard — 357                                                      |
| 4.5      | Summary — 360                                                                      |
|          | References — 361                                                                   |
