Danksagung	iii
Abstract	v
Abbreviations and symbols	xi
1 Introduction	1
2 Medical and Technical Background	5
2.1 Medical Background of Parkinson's Disease	5
2.1.1 Motor Symptoms and Disease Progression	6
2.1.2 Clinical Assessment and Treatment of Parkinson's Disease	9
2.1.3 Falls in Parkinson's Disease	11
2.1.4 Terminology and Definitions	12
2.2 Technical Background	14
2.2.1 Micro-Electromechanical Systems	14
2.2.2 Force Sensing Resistors	20
2.2.3 Body Sensor Networks	20
2.3 Mathematical Background	23
2.3.1 Orientation and Position	23
2.3.2 Orientation Estimation	27
2.3.3 The Kalman Filter	28
2.3.4 Machine Learning	33
3 Unobtrusive Monitoring System for Gait Analysis	37
3.1 Wireless Development Platform for Monitoring Systems	37
3.1.1 Radio	39
3.1.2 Proprietary Network Protocol	39
3.2 Sensing Modalities	42
3.2.1 Mobility Sensor	43
3.2.2 Measurement of Ground Reaction Forces	43
3.3 Long-Term Calibration Procedure for low-cost IMUs	45
3.3.1 Gyroscope Calibration	48
3.3.2 Accelerometer Calibration	50
3.3.3 Validation	51
3.4 Signal Processing and Sensor Fusion	54
3.4.1 Sagittal Plane Estimation	55
3.4.2 Orientation Estimation for Periodic Motion	67

3.5	Sparse Sensor Gait Monitoring	77
3.5.1	Redundancy in IMU-based Gait Analysis Data	78
3.5.2	Optimal Sensor Locations	79
3.6	Summary	81
4	Model-based Assessment of Gait Stability	83
4.1	Gait Stability from a Systems Theory Perspective	83
4.2	Kinematic Modeling of Human Gait	85
4.2.1	DH-parameter-based Human Gait Model	86
4.2.2	Patient-individual Model Parameterization	87
4.2.3	Joint Angle Trajectories	89
4.2.4	Model-based Determination of Gait Stability	90
4.2.5	Dynamic Balance of Physiological and PD-affected Gait	95
4.3	Gait Segmentation	98
4.3.1	Detection of Physical Activity in Long-term Measurements	98
4.3.2	Peak Detection	99
4.4	Model-based Parameters for the Assessment of Gait Stability	104
4.4.1	Vertical Displacement Estimation	104
4.4.2	Step Length Estimation	109
4.4.3	Model-based Analysis of Gait Stability	115
4.5	Summary	120
5	Gait Assessment in Parkinson's Disease during Everyday Life	121
5.1	Data-driven Surrogate Parameters for Gait Stability	121
5.1.1	Non-linear Stability Analysis	121
5.1.2	Sensor-based Features	126
5.1.3	Validation of the Feature Set	128
5.2	Identification of Intra-individually Altered Gait Parameters	131
5.2.1	Stride Extraction Performance	134
5.2.2	Discrimination of Artificially Induced Gait Impairments	135
5.3	Monitoring of Parkinson's Disease in Clinical Everyday Life	138
5.3.1	Clinical Trial Design	139
5.3.2	Baseline Characteristics	141
5.3.3	The Unified Parkinson's Disease Rating Scale	142
5.3.4	Clinical Mobility Tests	143
5.3.5	Signal Processing Chain	145
5.3.6	Correlation to Clinically Relevant Parameters	147
5.3.7	Individual Considerations	153
5.4	Summary	154
6	Conclusion	157

A	Appendix	161
A.1	Simulative Validation of the Calibration Procedure	161
A.2	Exemplary Joint Angle Trajectories	163
A.3	Human Gait Model	164
A.4	Derivation of the Zero Moment Point	165
A.5	IMU Signal Morphology	167
A.6	Peak Detection Algorithm (Pseudo-Code)	167
A.7	FSR-based Stride Extraction	167
A.8	MDS-UPDRS Part III	173
A.9	Classification of Recurrent Fallers	173
A.10	UPDRS Assessments	173
B	Publications	177
	Bibliography	181
