Preface — V

Marianne Akian and Eric Fodjo

- 1 From a monotone probabilistic scheme to a probabilistic max-plus algorithm for solving Hamilton–Jacobi–Bellman equations — 1**
 - 1.1 Introduction — 1
 - 1.2 The probabilistic method of Fahim, Touzi, and Warin — 4
 - 1.2.1 General description — 4
 - 1.2.2 Examples and comparison with finite difference scheme constraints — 6
 - 1.3 A monotone probabilistic scheme for fully nonlinear PDEs — 8
 - 1.4 The probabilistic max-plus method — 14
 - 1.5 Numerical tests — 19

Jan Blechschmidt and Roland Herzog

- 2 Improving policies for Hamilton–Jacobi–Bellman equations by postprocessing — 25**
 - 2.1 Introduction — 25
 - 2.1.1 Notation and introductory example — 26
 - 2.2 Postprocessing of HJB controls — 27
 - 2.2.1 Main idea — 28
 - 2.2.2 Evaluation of postprocessed control — 29
 - 2.3 Numerical examples — 30
 - 2.3.1 Minimum arrival time — 30
 - 2.3.2 Optimal energy storage — 34
 - 2.4 Conclusion and Outlook — 39
 - 2.5 Appendix: Parameters for the energy storage problem — 40

Nikolai D. Botkin, Johannes Diepolder, and Varvara L. Turova

- 3 Viability approach to simulation of an adaptive controller — 43**
 - 3.1 Introduction — 43
 - 3.2 Model equations — 44
 - 3.2.1 Uncertain Plant Model — 44
 - 3.2.2 Reference model — 44
 - 3.2.3 Adaptive control law — 45
 - 3.2.4 Closed-loop dynamic equations — 45
 - 3.3 Problem setting and simulation results — 46
 - 3.4 Conclusion — 56
 - 3.5 Appendix — 56

- 3.5.1 Differential game — **56**
- 3.5.2 Viability kernel — **56**
- 3.5.3 Grid method for computing viability kernels — **57**
- 3.5.4 Control design — **58**
- 3.5.5 Computer implementation — **59**
- 3.5.6 Comparison with existing software — **59**

Mickaël D. Chekroun, Axel Kröner, and Honghu Liu

- 4 Galerkin approximations for the optimal control of nonlinear delay differential equations — 61**
 - 4.1 Introduction — **61**
 - 4.2 Optimal control of DDEs: Galerkin–Koornwinder approximations — **63**
 - 4.2.1 Recasting a DDE into an infinite–dimensional evolution equation — **64**
 - 4.2.2 Galerkin–Koornwinder approximation of DDEs — **66**
 - 4.2.3 Galerkin–Koornwinder approximation of nonlinear optimal control problems associated with DDEs — **69**
 - 4.3 Application to an oscillation amplitude reduction problem — **76**
 - 4.3.1 Optimal control of the Wright equation — **76**
 - 4.3.2 Galerkin–Koornwinder approximation of the optimal control problem — **80**
 - 4.3.3 Numerical results — **81**
 - 4.4 Towards the approximation of HJB equations associated with DDEs — **86**
 - 4.5 Concluding remarks — **93**

Jochen Garcke and Ilja Kalmykov

- 5 Efficient higher order time discretization schemes for Hamilton–Jacobi–Bellman equations based on diagonally implicit symplectic Runge–Kutta methods — 97**
 - 5.1 Introduction — **97**
 - 5.2 Semi-Lagrangian scheme for the Hamilton–Jacobi–Bellman equation — **100**
 - 5.2.1 Semi-Lagrangian schemes for optimal control problems — **100**
 - 5.2.2 Examples of semi-Lagrangian schemes — **101**
 - 5.3 Sparse grids — **103**
 - 5.4 Semi-Lagrangian schemes with higher order time discretization — **106**
 - 5.4.1 Composition methods — **108**
 - 5.4.2 Semi-Lagrangian schemes with implicit midpoint rule — **112**
 - 5.4.3 Optimization of the control — **115**
 - 5.4.4 Algorithm for higher order semi-Lagrangian schemes with DISRK methods — **119**
 - 5.5 Numerical tests — **121**

- 5.5.1 One-dimensional system with nonlinear dynamics — 121
- 5.5.2 Harmonic oscillator — 124
- 5.6 Conclusion and outlook — 127

Max Jensen

- 6 Numerical solution of the simple Monge–Ampère equation with nonconvex Dirichlet data on nonconvex domains — 129**
 - 6.1 Introduction — 129
 - 6.2 The Bellman formulation and its semi-Lagrangian approximation — 130
 - 6.3 The Monge–Ampère equation on nonconvex domains — 132
 - 6.4 The simple Monge–Ampère equation with nonconvex boundary data — 134
 - 6.5 The simple Monge–Ampère equation on nonconvex domains without a classical subsolution — 137
 - 6.6 Conclusions — 142

Max Jensen and Iain Smears

- 7 On the notion of boundary conditions in comparison principles for viscosity solutions — 143**
 - 7.1 Introduction — 143
 - 7.2 Dirichlet boundary conditions as in the Barles–Souganidis theorem — 146
 - 7.3 Dirichlet boundary conditions as in the User’s Guide — 147
 - 7.4 Dirichlet boundary conditions in the classical sense — 148
 - 7.5 An example on a bounded domain — 149
 - 7.6 Mixed Dirichlet–Neumann boundary conditions as in the Barles–Souganidis theorem — 151

Athena Picarelli, Christoph Reisinger, and Julen Rotaetxe Arto

- 8 Boundary mesh refinement for semi-Lagrangian schemes — 155**
 - 8.1 Introduction — 155
 - 8.2 Domain overstepping and stencil truncation — 158
 - 8.2.1 Overstepping — 158
 - 8.2.2 Constant extrapolation — 159
 - 8.2.3 Stencil cropping — 159
 - 8.2.4 Stencil truncation — 159
 - 8.3 Local mesh refinement — 160
 - 8.3.1 General mesh construction — 161
 - 8.3.2 Mesh construction in one dimension — 163
 - 8.3.3 Properties of the refined scheme with stencil truncation — 164
 - 8.4 Numerical tests — 164

8.4.1	Test 1: Linear equation —	165
8.4.2	Test 2: Controlled drift-diffusion equation —	168
8.4.3	Test 3: Nonsmooth initial data —	170
8.5	Conclusions —	173

Sebastian Steck and Karsten Urban

9	A reduced basis method for the Hamilton–Jacobi–Bellman equation within the European Union Emission Trading Scheme —	175
9.1	Introduction —	176
9.2	Preliminaries —	177
9.2.1	Mathematical model for the European Union Emission Trading System (EU-ETS) —	177
9.2.2	Hamilton–Jacobi–Bellman (HJB) equation —	179
9.3	Discretization —	181
9.3.1	“Truth” discretization —	181
9.3.2	A nonlinear system for control and state —	182
9.3.3	Well-posedness and error control —	184
9.4	The reduced basis method (RBM) —	186
9.4.1	Computation of a lower inf-sup bound —	187
9.4.2	Offline/online-separation —	189
9.4.3	Greedy algorithm —	190
9.5	Numerical experiments —	191
9.5.1	Discretization —	192
9.5.2	Estimation of the inf-sup constant —	192
9.5.3	Error estimator —	192

Index — 197
