

CONTENT

1 Review of the theory of probability and random variables	1
1.1 Some probability theory	1
1.2 Random variables and distributions	4
1.3 Expectations	7
1.4 Functions of one random variable	14
1.5 More than one random variable: random vectors and multivariate distributions	17
1.6 Conditional distributions, density functions and expectations	23
1.7 Multivariable Gaussian distribution	27
1.8 Functions of two random variables	29
1.9 Worked examples	35
2 Fundamentals of stochastic processes	55
2.1 Basic concepts	55
2.2 Gauss-Markov stochastic process	59
2.3 Properties of stochastic processes	64
2.4 Spectral representation of stochastic processes	69
2.5 The concept of white noise	72
2.6 Worked examples	75
3 Linear discrete-time stochastic systems	81
3.1 Transfer function models	81
3.1.1 Linear filtering	81
3.1.2 Stability	85
3.1.3 Spectral factorization	86
3.1.4 Polynomial representation: ARMAX models	88
3.2 State-space models	91
3.2.1 Analysis	91
3.2.2 Equivalence of linear models: transformation of state-space model to transfer function model	96
3.2.3 Equivalence of linear models: Transformation of ARMAX to state space model	100
3.2.4 Observability and controllability	107
4 Linear continuous-time stochastic systems	115
4.1 Input-output models	115
4.1.1 Stability	116
4.1.2 Linear filtering	116
4.1.3 Spectral factorization	121
4.1.4 The concept of stochastic process with uncorrelated increments (Wiener process)	122
4.2 State-space models	127
4.3 Discretization of continuous stochastic systems	144
4.4 State-space and transfer function models equivalence	149

5 Fundamentals of estimation	155
5.1 Bayes cost method	156
5.1.1 Mean square error criterion - Minimum Variance Estimator	156
5.1.2 Mean Square Estimation given a random process	161
5.2 Uniform cost function: Maximum A posteriori Estimator	164
5.3 Maximum likelihood estimation	167
5.4 Absolute-value cost function	169
5.5 Linear mean-square estimation (Linear minimum variance estimation)	170
5.6 Least-squares method	177
5.6.1 Sequential (recursive) least-squares method	181
5.7 Properties of estimators	183
5.7.1 Unbiased estimators	183
5.7.2 Efficient estimators	188
5.7.3 Asymptotic properties	197
6 Optimum nonrecursive linear estimation: Wiener filtering	205
6.1 Optimum nonrecursive estimator from discrete-time noisy measurement data	205
6.1.1 Optimum nonrecursive estimator for scalar random variable	205
6.1.2 Optimum nonrecursive estimator for multivariate random variables	213
6.1.3 Optimum nonrecursive estimator for time-varying discrete-time signals	215
6.1.4 Wiener estimator design for nonstationary time-varying discrete-time multivariate signals	231
6.2 Optimum nonrecursive estimator from continuous-time noisy measurements	240
6.2.1 Optimum nonrecursive estimator for scalar random variable	240
6.2.2 Optimum nonrecursive estimator for multivariate random variable	243
6.2.3 Optimum nonrecursive estimator for time-varying stationary continuous-time signals	244
7 Optimum recursive linear estimation: Kalman filtering	253
7.1 Continuous estimation with discrete observations	253
7.1.1 Basic concepts in estimation	254
7.1.2 Linear minimum variance estimator by block processing	256
7.1.3 Linear sequential continuous estimation from discrete observations (continuous-discrete Kalman filtering)	260
7.1.4 Geometric concept: Orthogonality principle	267
7.1.5 Optimal prediction	269
7.2 Discrete estimation with discrete observations (discrete Kalman filter)	275
7.2.1 Optimal discrete-time prediction	280
7.3 Continuous estimation with continuous observations	290
7.3.1 Orthogonality principle (derivation from Wiener-Hopf equation)	294
7.4 Sequential weighting in Kalman filter	298
7.5 Innovations property of the Kalman filter	300
7.6 Stochastic controllability, observability and stability	304
7.7 Statistical steady state (the link between Wiener and Kalman filter)	307
8 Extensions of the optimum recursive (Kalman) filter	313
8.1 Correlated noise and shaping filters	313
8.1.1 Coloured process noise	313
8.1.2 Correlated measurement and process noises	318
8.1.3 Correlated measurement noise	324
8.2. Nonlinear minimum variance estimation (the extended Kalman filter)	331
8.2.1 Continuous-discrete linearized and extended Kalman filters	331
8.2.2 Discrete linearized and extended Kalman filters	346
8.2.3 Continuous linearized and extended Kalman filters	358

8.3. Adaptive filtering-----	361
8.3.1. Parameter-adaptive filtering -----	361
8.3.2 Noise-adaptive filtering -----	368
8.3.3. Multiple model estimation -----	378
Appendix A: Properties of Laplace and Z transforms-----	385
Appendix B: A review of matrix analysis -----	392
Appendix C: Table of common probability density functions -----	404
References -----	407
Index -----	411
