Introduction	xi
---------------------------	----

Part I Introduction to Flag Domain Theory

1	Structure of Complex Flag Manifolds	5
1.1	Structure theory and the root decomposition	5
1.2	Cartan highest weight theory	9
1.3	Borel subgroups and subalgebras	14
1.4	Parabolic subgroups and subalgebras	17
1.5	Homogeneous holomorphic vector bundles	20
1.6	The Bott–Borel–Weil Theorem	22
2	Real Group Orbits	27
2.1	Bruhat Lemma and an application	27
2.2	Real isotropy	28
3	Orbit Structure for Hermitian Symmetric Spaces	31
3.1	Strongly orthogonal roots	31
3.2	Orbits and Cayley transforms	33
4	Open Orbits	37
4.1	Automorphisms and regular elements	37
4.2	Fundamental Cartan subalgebras and open G_0 -orbits	38
4.3	Compact subvarieties of open orbits	40
4.4	Holomorphic functions	42
4.5	Measurability of open orbits	44
4.6	Background on Levi geometry	46
4.7	The exhaustion function for measurable open orbits	50

5	The Cycle Space of a Flag Domain	55
5.1	Definitions and first properties	55
5.2	The three cases	57
5.3	Cycle spaces of measurable open orbits are Stein	58
5.4	The cycle space in the hermitian case	60
5.5	The classical hermitian case	66

Part II Cycle Spaces as Universal Domains

6	Universal Domains	77
6.1	Definitions and first properties	78
6.2	Adapted structure	83
6.3	Invariant CR structure and pseudoconvexity	84
7	B-Invariant Hypersurfaces in $\mathcal{M}_Z$	93
7.1	Iwasawa–Borel subgroups and their Schubert varieties	94
7.2	Envelope construction	96
7.3	Schubert intersection properties	101
7.4	Trace transform	104
8	Orbit Duality via Momentum Geometry	113
8.1	Coadjoint orbits	114
8.2	The K_0 -energy function	116
8.3	Duality	121
8.4	Orbit ordering	123
9	Schubert Slices in the Context of Duality	125
9.1	Schubert slices in arbitrary G_0 -orbits	126
9.2	Supporting hypersurfaces at the boundary of $\mathcal{M}_D$	130
10	Analysis of the Boundary of $\mathcal{U}$	133
10.1	Preparation	135
10.2	Linearization and the Jordan decomposition	141
10.3	Characterization of closed orbits	145
10.4	The slice theorem and related isotropy computations	148
10.5	Example: Two-dimensional affine quadric	152
10.6	$\mathfrak{sl}_2$ models at generic points of $\text{bd}(\mathcal{U})$	154
11	Invariant Kobayashi-Hyperbolic Stein Domains	163
11.1	Hyperbolicity of domains in G/K	164
11.2	The maximal invariant Kobayashi-hyperbolic Stein domain in an $\mathfrak{sl}_2$ -model	169
11.3	Maximality and the characterization of cycle domains	171

12	Cycle Spaces of Lower-Dimensional Orbits	175
12.1	Definition of cycle space	176
12.2	Intersection with Schubert varieties	177
12.3	Hypersurfaces in the complement of the cycle space	180
12.4	Cycle Spaces of nonclosed orbits	181
12.5	Cycle spaces of closed orbits	182
13	Examples	185
13.1	Cycle spaces of open $SL(n; \mathbb{R})$ -orbits	186
13.2	Cycle spaces for open $SU(p, q; \mathbb{F})$ -orbits	190
13.3	Slice methods and trace transforms for $SU(2, 1)$ domains	198

Part III Analytic and Geometric Consequences

14	The Double Fibration Transform	207
14.1	Double fibration	208
14.2	Pullback	208
14.3	Pushdown	209
14.4	Local G -structure of G_0 -bundles	210
14.5	The Schubert fibration	211
14.6	Contractibility of the fiber	213
14.7	Unitary representations of real reductive Lie groups	214
15	Variation of Hodge Structure	217
16	Cycles in the K3 Period Domain	225
16.1	Position of K3 surfaces in the Kodaira classification	226
16.2	Three classes of examples	227
16.3	Parameterizing K3 surfaces	231
16.4	The cycle space $\mathcal{M}_{D_+}$	234

Part IV The Full Cycle Space

17	Combinatorics of Normal Bundles of Base Cycles	243
17.1	Characterization of compact K -orbits	243
17.2	Base cycles and the arrangement of Borel subgroups	244
17.3	Normal bundles of base cycles	245
17.4	Module structure of the tangent space of a symmetric space	247
17.5	Shift of degree in the cohomology	253
17.6	Equivariant filtrations	257

18	Methods for Computing $H^1(C; \mathcal{O}(\mathbb{E}((\mathbf{q} + \theta \mathbf{q})_{\mathbf{s}})))$	259
18.1	Guide to the computation	259
18.2	Root systems and involutions	260
18.3	Various Weyl groups	267
18.4	Some distinguished weights	271
18.5	Computation of Bott-regular weights	277
18.6	Algorithm for computing the module structure of $T_{[\mathbf{C}]} \mathcal{C}(Z)$	284
19	Classification for Simple $\mathfrak{g}_0$ with $\text{rank } \mathfrak{k} < \text{rank } \mathfrak{g}$	289
19.1	Strategy	290
19.2	The series for $\mathfrak{g}_0 = \mathfrak{sl}(2r; \mathbb{R})$	290
19.3	The series for $\mathfrak{g}_0 = \mathfrak{sl}(2r + 1; \mathbb{R})$	293
19.4	The series for $\mathfrak{g}_0 = \mathfrak{so}(2p + 1, 2q + 1)$	296
19.5	The case $\mathfrak{g}_0 = \mathfrak{e}_{6,C_4}$	302
19.6	Preliminaries for the cases where $\mathfrak{g}_0$ is of complex type	304
19.7	The series for $\mathfrak{g}_0 = \mathfrak{so}(2r + 1; \mathbb{C})$	305
19.8	The series for $\mathfrak{g}_0 = \mathfrak{sp}(r; \mathbb{C})$	306
19.9	The case $\mathfrak{g}_0 = \mathfrak{f}_4(\mathbb{C})$	306
19.10	The case $\mathfrak{g}_0 = \mathfrak{g}_2(\mathbb{C})$	306
20	Classification for $\text{rank } \mathfrak{k} = \text{rank } \mathfrak{g}$	309
20.1	The series for $\mathfrak{g}_0 = \mathfrak{sp}(r; \mathbb{R})$	309
20.2	The series for $\mathfrak{g}_0 = \mathfrak{so}(2p, 2q + 1)$	313
20.3	The case $\mathfrak{g}_0 = \mathfrak{f}_{4,C_3A_1}$	317
20.4	The case $\mathfrak{g}_0 = \mathfrak{g}_{2,A_1A_1}$	319
20.5	Final table	321
	References	323
