

Table of Contents

1. Introduction	1
2. Quantum-mechanical few-body problems	7
2.1 Hamiltonian	7
2.2 Relative coordinates	9
2.3 Symmetrization	15
2.4 Permutation of the Jacobi coordinates	16
Complements	18
C2.1 An N -particle Hamiltonian in the heavy-particle center coordinate set	18
C2.2 Canonical Jacobi coordinates	19
3. Introduction to variational methods	21
3.1 Variational principles	21
3.2 The variance of local energy	30
3.3 The virial theorem	33
4. Stochastic variational method	39
4.1 Basis optimization	39
4.2 A practical example	43
4.2.1 Geometric progression	44
4.2.2 Random tempering	47
4.2.3 Random basis	47
4.2.4 Sorting	50
4.2.5 Trial and error search	50
4.2.6 Refining	53
4.2.7 Comparison of different optimizing strategies	54
4.3 Optimization for excited states	56
Complements	61

XII Table of Contents

C4.1 Minimization of energy versus variance	61
5. Other methods to solve few-body problems	65
5.1 Quantum Monte Carlo method:	
The imaginary-time evolution of a system	65
5.2 Hyperspherical harmonics expansion method	67
5.3 Faddeev method	70
5.4 The generator coordinate method	72
6. Variational trial functions	75
6.1 Correlated Gaussians	
and correlated Gaussian-type geminals	75
6.2 Orbital functions with arbitrary angular momentum ..	82
6.3 Generating function	87
6.4 The spin function	94
Complements	96
C6.1 Nodeless harmonic-oscillator functions as a basis	96
C6.2 Solid spherical harmonics	105
C6.3 Angular momentum recoupling	106
C6.4 Separation of the center-of-mass motion	
from correlated Gaussians	112
C6.5 Three electrons with $S = 1/2$	115
C6.6 Four electrons in an arbitrary spin arrangement	115
C6.7 Six electrons with $S = 0$	116
Exercises	118
7. Matrix elements for spherical Gaussians	123
7.1 Matrix elements of the generating function	123
7.2 Correlated Gaussians	125
7.3 Correlated Gaussians in two-dimensional systems	129
7.4 Correlated Gaussian-type geminals	131
7.5 Nonlocal potentials	134
7.6 Semirelativistic kinetic energy	137
Complements	143
C7.1 Sherman-Morrison formula	143
Exercises	145

8. Small atoms and molecules	149
8.1 Coulombic systems	149
8.2 Coulombic three-body systems	150
8.3 Four or more particles	154
8.4 Small molecules	165
Complements	167
C8.1 The cusp condition for the Coulomb potential	167
C8.2 The chemical bond: The H_2^+ ion	169
C8.3 Stability of hydrogen-like molecules	171
C8.4 Application of global vectors to muonic molecules	174
9. Baryon spectroscopy	177
9.1 The trial function in the constituent quark model	178
9.2 One-gluon exchange model	178
9.3 Meson-exchange model	181
10. Few-body problems in solid state physics	187
10.1 Excitonic complexes	188
10.2 Quantum dots	191
10.3 Quantum dots in magnetic field	196
10.4 Quantum dots in the generator coordinate method	202
Complements	204
C10.1 Two-dimensional electron motion in a magnetic field	204
11. Nuclear few-body systems	213
11.1 Introductory remark on nucleon-nucleon potentials	213
11.2 Few-nucleon systems with central forces	216
11.3 Realistic potentials	223
Complements	230
C11.1 Correlations in few-nucleon systems	230
C11.2 Convergence of partial-wave expansions	233
C11.3 Quark Pauli effect in s -shell A hypernuclei	239
C11.4 The ^{12}C nucleus as a system of three alpha-particles	242
Appendix	247
Matrix elements for general Gaussians	247
A.1 Correlated Gaussians	247
A.1.1 Overlap of the basis functions	247
A.1.2 Kinetic energy	249

XIV Table of Contents

A.1.3 Two-body interactions	250
A.1.4 Density multipole operators.....	256
A.2 Correlated Gaussians with different coordinate sets ...	257
A.3 Correlated Gaussian-type geminals	262
A.4 Spin matrix elements	263
A.5 Three-body problem with central, tensor and spin-orbit forces	265
Complements.....	280
CA.1 Matrix elements of central potentials	280
CA.2 Matrix elements of density multipoles	283
CA.3 Overlap matrix elements of the correlated Gaussians for a three-particle system	285
Exercises	288
References	299
Index	307
