Acronyms, abbreviations and common notation — XIII

Forewords — XVII

Introduction — XIX

Part I: Astrometric estimation

1	Earth rotation and space-time reference systems — 3
1.1	Earth rotation — 3
1.2	Terrestrial reference system — 4
1.3	Celestial reference system — 6
1.3.1	End of the absolute system — 6
1.3.2	The ether as a reminiscence of the absolute system — 8
1.3.3	Kinematic celestial reference systems — 9
1.3.4	Dynamical celestial reference system — 10
1.3.5	Drift of the Geocentric Dynamical Reference System with respect to the Kinematic Barycentric Reference System — 11
1.4	Reference time scale — 12
1.5	Space-time reference systems — 13
2	Geophysical irregularities of Earth's rotation: an overview — 17
2.1	Earth's rotation is irregular — 17
2.2	Precession–nutation — 18
2.3	Polar motion — 20
2.4	Variations of the Earth angular velocity — 24
2.5	Synthesis — 27
3	Astro-geodetic observations — 30
3.1	Introduction — 30
3.2	The Earth Orientation Parameters (EOP) — 30
3.2.1	Description of the transformation between terrestrial and celestial systems — 30
3.2.2	EOP n°1, n°2: Celestial Pole Offsets — 32
3.2.3	EOP n°3: UT1-UTC — 32
3.2.4	EOP n°4, n°5: pole coordinates (x , y) — 34
3.2.5	Full coordinate transformation from celestial reference system to terrestrial reference system — 35

3.3	Relation between EOP and components of the instantaneous rotation vector —	36
3.3.1	Kinematic relations —	36
3.3.2	Earth orientation parameters formulated as Euler angle perturbations —	37
3.3.3	Relation between the CIP and the instantaneous rotation pole —	39
3.3.4	Relation between LOD and UT1 —	39
3.3.5	Terrestrial motion of the instantaneous rotation pole —	40
3.4	Principles of the Earth Orientation Parameters determination —	42
3.4.1	Modeling of the astro-geodetic observations —	42
3.4.2	Linearization and least-square inversion —	43
3.5	Observations techniques —	47
3.5.1	Modern astro-geodetic techniques —	47
3.5.2	Evolution of the observation techniques —	50
3.6	Pole coordinates accuracy —	53
3.6.1	Need for a combined reference EOP solution —	53
3.6.2	Accuracy of the combined C04 solution —	54
3.6.3	Uncertainty versus stability for intra-technique solutions —	54
3.7	Conclusion —	59

Part II: Polar motion theory

4	Liouville equations —	63
4.1	General introduction of the second part —	63
4.2	Newtonian framework of the Earth rotation —	63
4.3	Liouville equations —	65
4.3.1	Dynamical Liouville equations —	65
4.3.2	Linearization at sub-secular scale —	70
4.3.3	Linearized Liouville equation in the Terrestrial Reference System —	72
4.4	Free and forced polar motion for a rigid Earth model —	73
4.4.1	Rigid Earth model: definition —	73
4.4.2	Biaxial Earth —	73
4.4.3	Triaxial Earth —	74
4.5	Celestial and terrestrial motion of the CIP —	76
4.6	Incompleteness of this formulation —	78
5	Dissipative rotational excitation function —	79
5.1	Centrifugal deformation —	79
5.2	Centrifugal potential —	81
5.3	Mean figure of the Earth —	82
5.4	Variable centrifugal effect on the inertia moments —	85

5.5	Influence of the Earth's non-rigidity on polar motion —	87
5.6	Damping —	88
5.6.1	Complex Chandler frequency —	88
5.6.2	Damping estimation —	91
5.7	Effect of a mass redistribution on polar motion —	93
6	Ocean pole tide —	95
6.1	Introduction —	95
6.2	Ocean pole tide —	95
6.3	Oceanic rotational excitation —	99
6.4	Liouville equation for a triaxial, anelastic Earth covered by the oceans —	103
6.5	Observational consequence —	105
6.5.1	Symmetric and asymmetric response to a circular excitation of fixed frequency —	105
6.5.2	Intrinsic ellipticity —	107
6.6	Dynamical ocean pole tide in the diurnal band —	109
6.7	Conclusion —	111
7	Influence of the fluid core —	113
7.1	Introduction —	113
7.2	Liouville equation for a biaxial fluid core —	114
7.2.1	Fluid core angular momentum —	114
7.3	Polar motion differential equation for a biaxial mantle —	119
7.3.1	General case —	119
7.3.2	Polar motion periods longer than 2 days —	120
7.4	Coupled core-mantle system in the retrograde diurnal band —	121
7.4.1	Differential equation system for core and extended mantle —	121
7.4.2	Free core nutation —	124
7.4.3	Solution in frequency domain —	126
7.4.4	Free core nutation —	127
7.5	Polar motion equation for a superficial fluid layer excitation in the retrograde diurnal band —	129
7.5.1	Effect of the matter term —	129
7.5.2	Effect of the motion term —	130
7.5.3	Total effect —	130
7.6	Frequency dependence of the Love number and consequences —	131
7.6.1	Convolution in time domain —	131
7.6.2	Theoretical frequency dependence of polar motion resonance —	132
7.6.3	Confirmation from nutation analysis —	133
7.6.4	Influence of the frequency dependent rheology on the geophysical transfer function —	134

- 7.7 Influence of the solid inner core — **136**
- 7.8 Conclusion — **137**

Part III: Geophysical forcing

- 8 Hydro-atmospheric excitation — 141**
 - 8.1 Introduction — **141**
 - 8.2 Hydro-atmospheric excitation — **142**
 - 8.2.1 A brief historical account — **142**
 - 8.2.2 Matter and motion term of the angular momentum functions — **143**
 - 8.2.3 Gravimetric matter term — **145**
 - 8.3 Nature of the coupling between a fluid layer and the solid Earth — **146**
 - 8.4 Atmospheric excitation — **151**
 - 8.4.1 Pressure term — **151**
 - 8.4.2 Wind term — **153**
 - 8.4.3 Inverted barometer oceans — **153**
 - 8.4.4 Atmospheric Angular Momentum functions and uncertainty — **155**
 - 8.5 Ocean excitation — **160**
 - 8.5.1 Dynamical ocean model — **160**
 - 8.5.2 Sea water level variations — **160**
 - 8.5.3 Currents — **161**
 - 8.5.4 Ocean Angular Momentum function and uncertainties — **161**
 - 8.6 Hydrological excitation — **165**
 - 8.7 Total excitation — **169**
 - 8.8 Conclusion — **169**
- 9 Equatorial angular momentum balance from two days to decadal time scale — 171**
 - 9.1 Liouville equation from two days to some decades — **171**
 - 9.2 Amplification of the prograde seasonal band — **173**
 - 9.3 Methodology — **174**
 - 9.4 Overall budget — **180**
 - 9.4.1 Accuracy of geodetic and angular momentum excitations — **180**
 - 9.4.2 Overall comparison — **180**
 - 9.4.3 Coherence over the time span 2000–2019 — **182**
 - 9.4.4 Allan deviation analysis over the period 2000–2019 — **184**
 - 9.5 Elliptical polarization of the excitation function — **185**
 - 9.5.1 Are prograde and retrograde terms interrelated independently from frequency? — **185**
 - 9.5.2 Prograde and retrograde terms and elliptical motion at a given frequency — **185**

9.5.3	Example of the seasonal excitation —	186
9.5.4	Linear dependence of prograde and retrograde parts —	189
9.5.5	Statistical distribution in spectral domain —	192
9.6	Concluding remarks —	195
10	Rapid, seasonal, inter-annual, and decadal excitations —	198
10.1	Introduction —	198
10.2	Rapid fluctuations —	198
10.2.1	Overview —	198
10.2.2	Spectral analysis of excitation functions —	199
10.2.3	Irregularities of the rapid fluctuations —	204
10.3	Seasonal cycle —	205
10.4	Inter-annual and infra-decadal variations —	207
10.5	Decadal and secular variations —	211
10.6	Conclusion —	212
11	Chandler's wobble —	214
11.1	An excited mode —	214
11.2	Theoretical lineaments —	215
11.3	Estimation of the Chandler wobble parameters —	217
11.4	Hydro-atmospheric reconstruction of the Chandler wobble —	220
11.5	Multi-decadal modulation of the Chandler excitation —	225
11.6	Asymmetric excitation of the Chandler wobble —	227
11.6.1	Theoretical reminder —	227
11.6.2	Analysis —	229
11.7	Conclusion and discussion —	229
12	Diurnal and sub-diurnal hydro-atmospheric effect —	232
12.1	Geophysical diurnal and sub-diurnal effects —	232
12.2	Liouville equation in the retrograde diurnal band —	233
12.3	Diurnal and sub-diurnal atmospheric effect —	234
12.3.1	Four-daily AAM series —	234
12.3.2	Retrograde diurnal band —	235
12.3.3	Prograde diurnal and semi-diurnal bands —	237
12.3.4	Comparison of the results associated with NCEP, ECMWF-TUW, JMA models —	237
12.4	Diurnal and sub-diurnal non tidal oceanic effect on polar motion —	238
12.5	Combined effect of the atmosphere and the oceans —	240
12.6	Conclusion —	241
13	Fluid layer effect on nutation —	242
13.1	Formalism for fluid layer effect on Earth's nutation —	242

13.2	Overview of the celestial angular momentum series —	245
13.2.1	Data —	245
13.2.2	Spectral analysis of the atmospheric CEAM —	246
13.2.3	Spectral analysis of the oceanic CEAM —	246
13.3	The 2–30 day band of the atmospheric CEAM —	249
13.3.1	Proportionality between wind and pressure terms —	249
13.3.2	Tidally coherent wave at 13.6 days —	251
13.3.3	The quasi-weekly band —	253
13.3.4	Hydrostatic model of the tidal O_1 oscillation of the pressure term —	254
13.3.5	Oceanic CEAM in the 2–30 day band (25–48 hours) —	256
13.4	Contribution on lunisolar nutation —	256
13.4.1	Fluid layer contribution to lunisolar nutations —	256
13.4.2	Comparison with observed lunisolar nutations —	257
13.5	Excitation of the free core nutation —	262
13.6	Conclusion —	266
14	Seismic effect —	267
14.1	Introduction —	267
14.2	Theoretical bases —	268
14.3	Modeling of the co-seismic excitation —	270
14.4	Excitation of the Chandler wobble —	275
14.5	Discussion —	276
14.6	Conclusion —	278
15	Epilogue: Geological polar motion —	279
15.1	Geological mass redistribution —	279
15.2	Nonlinear Liouville equations —	279
15.3	Visco-elastic variation of the moments of inertia —	280
15.4	Linear approach —	284
15.4.1	General formulation —	284
15.4.2	Qualitative analysis for an increasing surface load —	286
15.4.3	Transient mass redistribution like glaciation followed by melting —	288
15.5	Nonlinear treatment —	291
15.5.1	General formulation —	291
15.5.2	Permanent mass redistribution like mountain upheaval —	294
15.6	Readjustment of the main pole of inertia —	294
15.7	Conclusion —	297

Synthesis — 299

Appendix — 303

A	Generalized Liouville equations — 303
A.1	Definition — 303
A.2	Solution of the generalized linearized Liouville equations — 303
A.2.1	Solution in frequency domain and eigenfrequencies — 303
A.2.2	Solution in time domain — 305
A.2.3	Effect on a forced oscillation at the angular frequency σ_0 — 306
A.3	Generalized geodetic excitation and digitization — 306
B	Spherical harmonic coefficients of the geopotential and moments of inertia — 309
B.1	Spherical harmonic functions — 309
B.2	Spherical harmonic development of the geopotential — 311
B.3	Stokes coefficients of degree 2 and moment of inertia of the Earth — 312
C	Earth figure — 315
C.1	Spherical harmonic expansion of the radius of the Earth — 315
C.2	Effect of a infinitesimal rotation on a spherical harmonic development of degree 2 — 315
C.3	Inertia matrix transformation from principal axis frame to TRF — 317
D	Tidal perturbation and Love number resonance in the diurnal band — 321
D.1	Tesseral tidal potential — 321
D.2	Resonance of the geopotential Love number k_2 — 322
D.3	Resonance of the loading Love number k'_2 — 322
E	Matter term, pressure torque and loading effect — 325
E.1	Matter term expressed as a function of the tesseral component of the surface pressure — 325
E.2	Spherical harmonic expansion of the pressure torque — 325
E.2.1	Equatorial torque — 326
E.2.2	Axial pressure torque — 328
E.3	Loading Love number — 329
E.4	Relation between atmospheric torques and angular momentum in a non rotating frame — 331
F	Modeling the fluid core motion — 333
F.1	Poincaré flow — 333
F.2	Order of magnitude of the residual torque on the fluid core — 335
G	Statistics — 341
G.1	Correlation coefficient — 341

XII — Contents

G.2	Explained variance rate —	341
G.3	Coherence function —	341
G.4	Panteleev pass-band filter —	342
G.5	Allan variance —	343

H	Usual constants —	347
