Operators	xxix
Dimensions	xxix
List of Acronyms	xxxix
1 Introduction and Objectives	1
1.1 Introduction	1
1.1.1 Materials of fiber-reinforced structures	1
1.2 Fuel cell vehicles	2
1.2.1 Hydrogen storage system	3
1.2.2 Filament winding	5
1.3 Failure of fiber-reinforced structures	6
1.4 Aspects of modeling	7
1.5 Impact behavior of composite structures	9
1.6 Motivation	11
1.7 State of the art	11
1.7.1 Efficient modeling of thick composite structures with multi-layered solid finite elements	12
1.7.2 Modeling failure and damage in composite structures	13
1.8 Objectives and methodology	16
1.8.1 CAE tool chain	16

1.8.2	Hierarchical approach of the methodology	18
1.9	Outline	20
2	Continuum Mechanics and Finite Element Method	21
2.1	Kinematics	21
2.1.1	Motion and configuration	21
2.1.2	Deformation gradient	23
2.1.3	Strain tensors	25
2.1.4	Deformation velocities	26
2.2	Stress tensors	27
2.3	Balance relations	27
2.3.1	Balance of mass	28
2.3.2	Balance of momentum	29
2.3.3	Balance of angular momentum	31
2.3.4	Balance of energy	31
2.3.5	Balance of entropy and dissipation inequality . . .	33
2.4	Major stages in LS-DYNA [®] explicit FEM code	35
3	Multi-Layered Solid	39
3.1	Summary	39
3.2	Numerical modeling of composite structures	39
3.2.1	Introduction	39
3.2.2	C_Z^0 continuity requirements in multi-layered structures	41
3.2.3	Different ways of modeling thick composite laminates	42
3.2.4	Constitutive behavior of single lamina	43
3.3	Eight-node multi-layered solid element	46
3.4	Kinematics and interpolation	47
3.5	Discretized gradient operator	48
3.6	Meso-level homogenization of laminates	50
3.6.1	Transverse normal stresses and YOUNG's elasticity modulus	51
3.6.2	Transverse shear stresses and shear moduli	52
3.6.3	Elastic stress strain relations for multi-layered solid element	54
3.7	Numerical examples	56
3.7.1	Single-element tests for verification of in-plane stresses	56
3.7.2	Single-element tests for verification of transverse normal stress in the through-thickness direction . .	60
3.7.3	Cantilever beam	62
3.7.4	Plate under uniform load	62

3.7.5	Pinched cylinder	63
3.7.6	Cantilever beam under pressure loading	64
3.7.7	Cantilever beam under end load	65
3.7.8	Thick-walled cylinder under internal pressure . . .	67
3.7.9	PAGANO's analytical solution	69
3.8	Conclusions	72
4	Intra-Laminar Failure Analysis Based on PUCK's Theory	73
4.1	Summary	73
4.2	Failure of UD fiber-reinforced composites	74
4.2.1	Scales and coordinate systems of material	74
4.2.2	Types of failure	77
4.2.3	Successive failure	78
4.3	Failure criteria for CFRP according to PUCK	81
4.3.1	Application-oriented aspects of PUCK's inter fiber failure criterion	82
4.4	Fiber failure	85
4.5	Inter fiber failure	86
4.5.1	Two-dimensional stress states	86
4.5.2	Three-dimensional stress states	88
4.6	Conclusions	94
5	Post-Failure Analysis Based on PUCK's Theory	95
5.1	Progressive failure of composite materials	95
5.2	Degradation according to PUCK	97
5.2.1	Transverse tensile stress in the lamina affected by inter fiber failure	97
5.2.2	Transverse compressive stress in the lamina affected by inter fiber failure	98
5.2.3	Effect of fiber fracture	100
5.2.4	Chronology of PUCK degradation	100
5.3	Stress computation	104
5.4	Conclusions	104
6	Graphical Representation of Stress Strain Behavior in Fiber-Reinforced Composites	107
6.1	Material property testing for Opel specimens	107
6.2	Verification of elastic properties and PUCK's failure theory	109
6.2.1	One-element uniaxial verification test with $[0^\circ/0^\circ/0^\circ/0^\circ]$ laminate setup	111
6.2.2	Tension/compression-torsion	117

6.2.3	Laminate load cases	118
6.3	Conclusions	120
7	Proposed Damage Model	121
7.1	Limitations of the currently implemented material models	121
7.2	Requirements of new material models	124
7.3	Thermodynamical approach	125
7.4	Failure mechanisms of fiber-reinforced composites	128
7.4.1	Fiber failure or longitudinal failure	129
7.4.2	Inter-fiber failure or transverse failure	130
7.4.3	Interlaminar failure (delamination)	132
7.4.4	Qualitative example showing progressive failure of cross ply laminates	133
7.5	Damage variables, effective stresses and compliance tensor	134
7.5.1	Damage variables and the concept of effective stresses	134
7.5.2	Constitutive tensor of damaged UD laminae . . .	137
7.6	Loading surfaces and loading conditions	139
7.6.1	Loading criteria	139
7.6.2	Loading conditions	142
7.7	Kinetic assumption	142
7.7.1	General form of damage rule	143
7.7.2	Growth functions	143
7.8	Implementation of user-defined material in LS-DYNA® .	147
7.8.1	Program structure	147
7.8.2	Input parameters and history variables	148
7.9	Numerical examples for failure analysis	151
7.9.1	Verification example: One element test	151
7.9.2	Verification example: Thin-walled tube	154
7.9.3	Cross-ply laminate under uniaxial tensile loading	157
7.10	Summary and concluding remarks	160
8	Verification and Validation	161
8.1	Verification	161
8.1.1	UD laminate cube under tension	161
8.1.2	Predicted modulus change	162
8.2	Validation	163
8.2.1	Inner pressure of a $[\pm 20_2/90_4/\pm 20_2/90_4]$ -ring . .	163
8.2.2	Tension of a $[90_4/\pm 20_2]$ -tube	165
8.2.3	Four-point bending of a $[\pm 20_2/90_4/\pm 20_2/90_4]$ -tube	168
8.2.4	Ring impact test	172
8.2.5	Fall-tower impact test on an ambient pressure vessel	176

8.2.6	Three-point bending of a thin shell structure . .	180
8.2.7	World-wide failure exercise	182
8.2.8	Conclusions	184
9	Conclusions and Future Work	185
9.1	Summary	185
9.2	Future work	187
A	Belytschko and Bindeman: Eight Node Solid Hexahe-	
	dral Element	189
