

Contents

Preface — VII

1 Introduction — 1

- 1.1 The basic loss aggregation problem — 1
- 1.2 Description of the contents — 2

2 Frequency models — 5

- 2.1 A short list of examples — 5
 - 2.1.1 The Poisson distribution — 6
 - 2.1.2 Poisson mixtures — 7
 - 2.1.3 The negative binomial distribution — 8
 - 2.1.4 Binomial models — 9
- 2.2 Unified version — 9
- 2.3 Examples — 10
 - 2.3.1 Determining the parameter of a Poisson distribution — 11
 - 2.3.2 Binomial distribution — 18

3 Individual severity models — 22

- 3.1 A short catalog of distributions — 22
 - 3.1.1 Exponential distribution — 22
 - 3.1.2 The simple Pareto distribution — 23
 - 3.1.3 Gamma distribution — 23
 - 3.1.4 The lognormal distribution — 24
 - 3.1.5 The beta distribution — 24
 - 3.1.6 A mixture of distributions — 25
- 3.2 Numerical examples — 25
 - 3.2.1 Data from a density — 26

4 Some detailed examples — 30

- 4.1 Claim distribution and operational risk losses — 30
- 4.2 Simple model of credit risk — 31
- 4.3 Shock and damage models — 35
- 4.4 Barrier crossing times — 35
- 4.5 Applications in reliability theory — 36

5 Some traditional approaches to the aggregation problem — 38

- 5.1 General remarks — 38
 - 5.1.1 General issues — 39
- 5.2 Analytical techniques: The moment generating function — 40
 - 5.2.1 Simple examples — 41

5.3	Approximate methods —	44
5.3.1	The case of computable convolutions —	44
5.3.2	Simple approximations to the total loss distribution —	45
5.3.3	Edgeworth approximation —	46
5.4	Numerical techniques —	48
5.4.1	Calculations starting from empirical or simulated data —	48
5.4.2	Recurrence relations —	49
5.4.3	Further numerical issues —	50
5.5	Numerical examples —	50
5.6	Concluding remarks —	60
6	Laplace transforms and fractional moment problems —	62
6.1	Mathematical properties of the Laplace transform and its inverse —	62
6.2	Inversion of the Laplace transform —	64
6.3	Laplace transform and fractional moments —	66
6.4	Unique determination of a density from its fractional moments —	67
6.5	The Laplace transform of compound random variables —	67
6.5.1	The use of generating functions and Laplace transforms —	68
6.5.2	Examples —	70
6.6	Numerical determination of the Laplace transform —	72
6.6.1	Recovering a density on $[0, 1]$ from its integer moments —	73
6.6.2	Computation of (6.5) by Fourier summation —	74
7	The standard maximum entropy method —	76
7.1	The generalized moment problem —	77
7.2	The entropy function —	78
7.3	The maximum entropy method —	80
7.4	Two concrete models —	82
7.4.1	Case 1: The fractional moment problem —	82
7.4.2	Case 2: Generic case —	82
7.5	Numerical examples —	83
7.5.1	Density reconstruction from empirical data —	83
7.5.2	Reconstruction of densities at several levels of data aggregation —	87
7.5.3	A comparison of methods —	95
8	Extensions of the method of maximum entropy —	97
8.1	Generalized moment problem with errors in the data —	98
8.1.1	The bounded error case —	98
8.1.2	The unbounded error case —	100
8.1.3	The fractional moment problem with bounded measurement error —	101
8.2	Generalized moment problem with data in ranges —	102
8.2.1	Fractional moment problem with data in ranges —	104

8.3	Generalized moment problem with errors in the data and data in ranges — 105
8.4	Numerical examples — 106
8.4.1	Reconstruction from data in intervals — 107
8.4.2	Reconstruction with errors in the data — 109
9	Superresolution in maxentropic Laplace transform inversion — 113
9.1	Introductory remarks — 113
9.2	Properties of the maxentropic solution — 114
9.3	The superresolution phenomenon — 115
9.4	Numerical example — 117
10	Sample data dependence — 119
10.1	Preliminaries — 119
10.1.1	The maximum entropy inversion technique — 120
10.1.2	The dependence of λ on μ — 122
10.2	Variability of the reconstructions — 123
10.2.1	Variability of expected values — 127
10.3	Numerical examples — 128
10.3.1	The sample generation process — 128
10.3.2	The ‘true’ maxentropic density — 129
10.3.3	The sample dependence of the maxentropic densities — 130
10.3.4	Computation of the regulatory capital — 134
11	Disentangling frequencies and compounding losses — 136
11.1	Disentangling the frequencies — 136
11.1.1	Example: Mixtures of Poisson distributions — 138
11.1.2	A mixture of negative binomials — 143
11.1.3	A more elaborate case — 143
11.2	Decomposing the losses — 146
11.2.1	Simple case: A mixture of two populations — 148
11.2.2	Case 2: Several loss frequencies with different individual loss distributions — 150
12	Computations using the maxentropic density — 152
12.1	Preliminary computations — 152
12.1.1	Calculating quantiles of compound variables — 153
12.1.2	Calculating expected losses given that they are large — 154
12.1.3	Computing the quantiles and tail expectations — 154
12.2	Computation of the VaR and TVaR risk measures — 155
12.2.1	Simple case: A comparison test — 155
12.2.2	VAR and TVaR of aggregate losses — 158

12.3	Computation of risk premia —	159
13	A solution to the capital allocation problem —	162
13.1	Introduction and preliminaries —	162
13.2	Numerical results —	164
13.2.1	The capital allocation —	164
13.2.2	Problem 2: Determining the distortion function from given risk prices —	166
13.3	Appendices —	172
13.3.1	Application of MEM to determine the capital allocation —	172
13.3.2	Distorted risk measure —	175
13.3.3	Application of MEM to determine the distortion measure —	176
13.3.4	A numerical instability issue —	177
14	Review of statistical procedures —	179
14.1	Parameter estimation techniques —	179
14.1.1	Maximum likelihood estimation —	179
14.1.2	Method of moments —	180
14.2	Clustering methods —	181
14.2.1	K-means —	181
14.2.2	EM algorithm —	182
14.2.3	EM algorithm for linear and nonlinear patterns —	183
14.2.4	Exploratory projection pursuit techniques —	185
14.3	Approaches to select the number of clusters —	187
14.3.1	Elbow method —	187
14.3.2	Information criteria approach —	187
14.3.3	Negentropy —	188
14.4	Validation methods for density estimations —	188
14.4.1	Goodness of fit test for discrete variables —	189
14.4.2	Goodness of fit test for continuous variables —	189
14.4.3	A note about goodness of fit tests —	191
14.4.4	Visual comparisons —	192
14.4.5	Error measurement —	192
14.5	Beware of overfitting —	193
14.6	Copulas —	194
14.6.1	Examples of copulas —	195
14.6.2	Simulation with copulas —	202

Bibliography — 205

Index — 209
