## Preface — XIII

### 1 Introduction — 1

- 1.1 Introduction — 1
- 1.2 Aerospace structures — 1
- 1.3 Aerospace structures – transition to composite materials — 5
- 1.4 Basic topics in elasticity — 10
  - 1.4.1 Stresses, strains and rigid body rotations — 10
  - 1.4.2 Equilibrium and compatibility equations in elasticity — 15
  - 1.4.3 Plane stress and plane strain (2D representations) — 22
  - 1.4.3a Plane stress problems — 22
  - 1.4.3b Plane strain problems — 24
  - 1.4.4 The Airy function  $\phi(x, y)$  — 26
  - 1.4.5 Thermal field — 28
- References — 29

### 2 Composite materials — 30

- 2.1 Introduction — 30
  - 2.1.1 General introduction — 30
- 2.2 Unidirectional composites — 33
- 2.3 Properties of a single ply — 34
- 2.4 Transformation of stresses and strains — 35
- 2.5 The classical lamination theory — 38
- 2.6 First-order shear deformation theory — 44
- 2.7 Higher order theories — 49
- References — 65

### 3 Design formulas — 68

- 3.1 Introduction — 68
- 3.2 Airy functions — 68
- 3.3 Distribution of the shear forces, moments, deflections and slopes for beams — 69
- 3.4 Natural frequencies for common basic structures — 69
- 3.5 Torsion of bars — 81
- References — 84

### 4 Introduction to fatigue — 85

- 4.1 Introduction — 85
- 4.2 Definition of fatigue — 85
  - 4.2.1 Basic fatigue concepts — 86

|          |                                                                          |            |
|----------|--------------------------------------------------------------------------|------------|
| 4.2.2    | The four steps of fatigue failure —                                      | <b>89</b>  |
| 4.3      | The $S$ - $N$ curve —                                                    | <b>89</b>  |
| 4.3.1    | The probability distributions for fatigue life —                         | <b>92</b>  |
| 4.3.2    | Fatigue life for various combinations of alternating and mean stresses — | <b>94</b>  |
| 4.4      | Miner rule - the cumulative damage —                                     | <b>95</b>  |
| 4.5      | Fatigue of composite materials —                                         | <b>96</b>  |
|          | References —                                                             | <b>100</b> |
|          | Appendix A: Application of Fig. 4.6 and its associated equations —       | <b>102</b> |
| <b>5</b> | <b>Introduction to crack propagation analysis —</b>                      | <b>104</b> |
| 5.1      | Introduction —                                                           | <b>104</b> |
| 5.2      | Foundations of fracture mechanics —                                      | <b>104</b> |
| 5.2.1    | Introductory concepts —                                                  | <b>104</b> |
| 5.2.2    | Basic failure modes —                                                    | <b>106</b> |
| 5.2.3    | The stress intensity factor, $K$ —                                       | <b>107</b> |
| 5.2.4    | The energy release rate, $G$ —                                           | <b>108</b> |
| 5.2.5    | The $J$ -integral —                                                      | <b>110</b> |
| 5.2.6    | The crack opening displacement —                                         | <b>111</b> |
| 5.2.7    | Some closure notes —                                                     | <b>111</b> |
| 5.3      | Fatigue crack propagation —                                              | <b>112</b> |
| 5.3.1    | Introductory concepts —                                                  | <b>112</b> |
| 5.3.2    | The Paris law —                                                          | <b>112</b> |
| 5.3.3    | Experimental fracture mechanics —                                        | <b>114</b> |
| 5.3.3a   | Experimental determination of the Paris law —                            | <b>114</b> |
| 5.3.3b   | Experimental determination of the Paris law constants —                  | <b>115</b> |
|          | References —                                                             | <b>118</b> |
| <b>6</b> | <b>Buckling of thin-walled structures —</b>                              | <b>120</b> |
| 6.1      | Introduction —                                                           | <b>120</b> |
| 6.2      | Buckling of columns —                                                    | <b>120</b> |
| 6.2.1    | Euler buckling —                                                         | <b>120</b> |
| 6.2.2    | Rankin-Gordon formula —                                                  | <b>123</b> |
| 6.2.3    | Composite columns - CLT approach —                                       | <b>124</b> |
| 6.2.3a   | Symmetric laminate ( $B_{11} = 0$ ) —                                    | <b>125</b> |
| 6.2.3b   | Nonsymmetric laminate ( $B_{11} \neq 0$ ) —                              | <b>129</b> |
| 6.3      | Buckling of columns - FSDT approach —                                    | <b>133</b> |
| 6.4      | Buckling of plates —                                                     | <b>136</b> |
| 6.4.1    | Buckling of isotropic plates —                                           | <b>137</b> |
| 6.4.2    | Buckling of orthotropic plates —                                         | <b>140</b> |
| 6.5      | Buckling of shells —                                                     | <b>146</b> |
| 6.5.1    | Buckling of isotropic shells —                                           | <b>147</b> |

|         |                                                                            |     |
|---------|----------------------------------------------------------------------------|-----|
| 6.5.2   | Buckling of isotropic cylindrical shells —                                 | 151 |
| 6.5.2.1 | Axial compression —                                                        | 151 |
| 6.5.2.2 | External pressure —                                                        | 152 |
| 6.5.2.3 | Torsion —                                                                  | 153 |
| 6.5.2.4 | Combined loadings —                                                        | 155 |
| 6.5.2.5 | Buckling of orthotropic cylindrical shells under axial compression —       | 155 |
| 6.5.2.6 | Buckling of orthotropic cylindrical shells under external pressure —       | 158 |
| 6.5.2.7 | Buckling of orthotropic cylindrical shells under torsion —                 | 158 |
| 6.5.2.8 | Combined bending and axial compression of orthotropic cylindrical shells — | 159 |
|         | References —                                                               | 159 |
|         | Appendix A: Nonsymmetric laminated composite beam – CLT approach —         | 162 |

## **7 Vibrations of thin-walled structures — 166**

|       |                                                                                                   |     |
|-------|---------------------------------------------------------------------------------------------------|-----|
| 7.1   | Introduction —                                                                                    | 166 |
| 7.1.1 | CLPT approach —                                                                                   | 166 |
| 7.1.2 | FSDPT approach —                                                                                  | 168 |
| 7.2   | Vibrations of columns – CLT approach —                                                            | 170 |
| 7.2.1 | Symmetric laminate ( $B_{11} = 0, I_1 = 0$ ) —                                                    | 171 |
| 7.2.2 | Nonsymmetric laminate ( $B_{11} \neq 0, I_1 \neq 0$ ) —                                           | 176 |
| 7.3   | Vibrations of columns – FSDT approach —                                                           | 177 |
| 7.3.1 | Symmetric laminate ( $B_{11} = 0, I_1 = 0$ ) —                                                    | 178 |
| 7.3.2 | Nonsymmetric laminate ( $B_{11} \neq 0, I_1 \neq 0$ ) —                                           | 182 |
| 7.4   | Vibrations of plates – CLPT approach —                                                            | 185 |
| 7.4.1 | Simply supported special orthotropic plates —                                                     | 185 |
| 7.4.2 | Simply supported on two opposite edges of special orthotropic plates —                            | 186 |
| 7.5   | Vibrations of cylindrical shells —                                                                | 187 |
| 7.5.1 | Isotropic shells —                                                                                | 187 |
| 7.5.2 | Laminated composite shells: a CLT approach —                                                      | 191 |
|       | References —                                                                                      | 192 |
|       | Appendix A: General solution for a nonsymmetrical beam resting on any boundary conditions —       | 193 |
|       | Appendix B: Matrix notation for the equilibrium equations using CLT approach —                    | 195 |
|       | Appendix C: The terms of the matrix notation for the equilibrium equations using FSDPT approach — | 196 |

## **8 Dynamic buckling of thin-walled structures — 197**

|     |                               |     |
|-----|-------------------------------|-----|
| 8.1 | Introduction —                | 197 |
| 8.2 | Dynamic buckling of columns — | 201 |

|          |                                                                                                      |            |
|----------|------------------------------------------------------------------------------------------------------|------------|
| 8.2.1    | Dynamic buckling of columns using CLT —                                                              | 201        |
| 8.2.2    | Dynamic buckling of columns using FSDT —                                                             | 204        |
| 8.3      | Dynamic buckling of plates —                                                                         | 206        |
| 8.4      | Dynamic buckling of thin-walled structures – numerical and experimental results —                    | 211        |
|          | References —                                                                                         | 220        |
|          | Appendix A: Calculation of the critical buckling load of a uniaxial loaded plate from test results — | 223        |
| <b>9</b> | <b>Optimization of thin-walled structures —</b>                                                      | <b>225</b> |
| 9.1      | Introduction —                                                                                       | 225        |
| 9.2      | The optimization process —                                                                           | 226        |
| 9.2.1    | Vocabulary and concepts —                                                                            | 226        |
| 9.2.1a   | The general design optimization process —                                                            | 227        |
| 9.3      | Structural optimization —                                                                            | 229        |
| 9.4      | Multidisciplinary and multiobjective design optimization —                                           | 229        |
| 9.5      | Methods of optimization —                                                                            | 231        |
| 9.6      | Classical optimization techniques —                                                                  | 231        |
| 9.7      | Numerical methods of optimization —                                                                  | 232        |
| 9.7.1    | Linear programming —                                                                                 | 233        |
| 9.7.2    | Integer programming —                                                                                | 234        |
| 9.7.3    | Nonlinear programming —                                                                              | 234        |
| 9.7.4    | Quadratic programming —                                                                              | 234        |
| 9.7.5    | Stochastic programming —                                                                             | 235        |
| 9.7.6    | Dynamic programming —                                                                                | 235        |
| 9.8      | Advanced optimization techniques —                                                                   | 236        |
| 9.8.1    | Hill climbing —                                                                                      | 236        |
| 9.8.2    | Simulated annealing —                                                                                | 237        |

## **10 Structural health monitoring (SHM) — 290**

|         |                                                                             |     |
|---------|-----------------------------------------------------------------------------|-----|
| 10.1    | Introduction —                                                              | 290 |
| 10.1.1  | Diagnosis —                                                                 | 291 |
| 10.1.2  | Damage prognosis —                                                          | 292 |
| 10.1.2a | Operating load monitoring —                                                 | 292 |
| 10.1.2b | Pattern recognition (PR) —                                                  | 293 |
| 10.1.2c | A strain measurement under constant static loading —                        | 293 |
| 10.1.2d | Modal analysis —                                                            | 293 |
| 10.1.2e | Principal component analysis —                                              | 295 |
| 10.1.3  | Predictive maintenance —                                                    | 295 |
| 10.2    | Applications —                                                              | 296 |
| 10.2.1  | Aerospace applications —                                                    | 296 |
| 10.2.2  | Civil applications —                                                        | 299 |
| 10.2.3  | General applications —                                                      | 300 |
| 10.3    | Monitoring natural frequencies of composite beams for detection of damage — | 300 |
|         | References —                                                                | 309 |
|         | Appendix A: Passive and active sensors —                                    | 312 |
|         | References —                                                                | 321 |

## **11 Vibration correlation technique — 323**

|      |                                                                        |     |
|------|------------------------------------------------------------------------|-----|
| 11.1 | Introduction —                                                         | 323 |
| 11.2 | Application of VCT to thin-walled structures under axial compression — | 323 |
| 11.3 | Application of the VCT to thin-walled structures under pure shear —    | 330 |

- 11.4      Conclusions — **344**  
            References — **345**

**12      Morphing flying vehicles — 349**

- 12.1      Introduction — **349**
- 12.2      A new morphing concept — **350**
- 12.2.1    Endurance improvement and morphing efficiency — **352**
- 12.2.1.1   Mission's scenario — **352**
- 12.2.1.2   Working points and morphing efficiency — **353**
- 12.2.1.3   Weight considerations — **359**
- 12.2.2    Morphing algorithm — **362**
- 12.2.2.1   Roll stability during the morphing process — **363**
- 12.2.3    Airfoil selection — **366**
- 12.2.3.1   Dominant aerobatic aircraft working point — **366**
- 12.2.3.2   Dominant glider aircraft working point — **367**
- 12.2.4    Wind tunnel models and testing — **369**
- 12.3      Results and discussion — **372**
- 12.4      Conclusions — **375**  
            References — **376**  
            Appendix A — **377**

**13      Large deflections of columns and plates — 379**

- 13.1      Introduction — **379**
- 13.2      Large deflections of columns — **379**
- 13.2.1    Large deflections of columns: literature review — **379**
- 13.2.2    Large deflections of columns: the Euler elastica case — **380**
- 13.2.3    Large deflections of columns: a cantilever under lateral tip force — **384**
- 13.2.4    Large deflections of columns: a cantilever uniform distributed load — **386**
- 13.3      Large deflections of rectangular plates — **390**
- 13.3.1    Large deflections of plates: literature review — **390**
- 13.3.2    Large deflections of plates: calculations — **395**  
            References — **411**

**14      Typical NDT methods: laser shearography and acoustic emission — 415**

- 14.1      Introduction and literature review — **415**
- 14.1.1    NDT for metallic structures — **415**
- 14.1.2    NDT for composite structures — **422**
- 14.2      Laser shearography — **426**
- 14.3      Acoustic emission — **430**
