List of Figures	xv
List of Tables	xxv
Glossaries	xxvii
1 Introduction	1
1.1 Motivation	1
1.2 Objectives	5
1.3 Original contributions	6
1.4 Outline of the text	7
2 Force identification methods – state of the art and research	9
2.1 Direct measurement	9
2.2 Indirect measurement: Bridge Weigh-In-Motion	11
2.3 Dynamic load identification	13
2.3.1 Moving force identification	13
2.3.2 Identification of non-moving forces	20
2.4 Conclusion	25
3 Fundamentals of bridge dynamics under moving loads	27
3.1 Generals	27
3.2 Analytical solution for a simply supported beam with uniformly distributed mass	27
3.2.1 Undamped free vibrations of a beam	27
3.2.2 Damped vibrations of a beam subjected to moving loads	30
3.3 Finite Element solution for dynamic analysis	33
3.3.1 Equations of motion	33
3.3.2 Natural frequencies and mode shapes	38
3.3.3 Solution using mode superposition	40
3.3.4 Solution using direct numerical integration	43
3.4 Conclusion	50
	xi

4	Introduction to inverse problems	51
4.1	Generals.....	51
4.2	Inverse and ill-posed problems	51
4.3	Direct methods for solving inverse problems	53
4.3.1	Normal equations.....	53
4.3.2	Tikhonov regularization.....	54
4.3.3	Singular value decomposition	55
4.4	Solutions based on optimization algorithms	57
4.4.1	General form of least squares problems.....	57
4.4.2	Concept of unconstrained optimization	58
4.4.3	Trust region strategy	59
4.4.4	Sensitivity analysis.....	64
4.5	Conclusion	69
5	Formulation of an inverse problem for moving force identification	71
5.1	Objective function	71
5.1.1	Vector of unknown variables.....	71
5.1.2	Measured and computed data.....	72
5.1.3	Main optimization criterion	74
5.1.4	Penalty functions	76
5.2	Sensitivity analysis	81
5.2.1	Gradient of the objective function	81
5.2.2	Hessian of the objective function	85
5.3	Optimization algorithm	89
5.4	Moving window approach	90
5.4.1	Forward sliding window	90
5.4.2	Backward sliding window	91
5.5	Conclusion	92
6	Numerical validation with simulated measurement data	93
6.1	System description	93
6.2	Simulated measurements.....	94
6.2.1	Reference load scenario 1	95
6.2.2	Reference load scenario 2	95
6.2.3	Reference load scenario 3	96
6.2.4	Generation of the simulated measurements	97
6.3	Computational parameters.....	98
6.3.1	Basic computational parameters	98
6.3.2	Initial values of the optimization process	100
6.3.3	Termination criteria of the optimization	101

- 6.4 Verification of the analytical sensitivities 102
 - 6.4.1 Gradient check 102
 - 6.4.2 Hessian check 103
- 6.5 Optimization results without penalty functions 105
 - 6.5.1 Analysis with noisy data 105
 - 6.5.2 Analysis with noise-free data 110
- 6.6 Optimization results including penalty functions 119
 - 6.6.1 Weighting factors of the penalty functions 120
 - 6.6.2 Effect of the backward sliding window approach..... 134
 - 6.6.3 Selected results of the optimization with noisy data 135
 - 6.6.4 Solution behavior with violated solvability conditions 144
- 6.7 Influence factors on the identification accuracy 146
 - 6.7.1 Effect of noise 146
 - 6.7.2 Effect of computational parameters 149
 - 6.7.3 Effect of the amount of modal information 154
 - 6.7.4 Effect of the modal truncation 156
 - 6.7.5 Effect of the sensor configuration 158
 - 6.7.6 Effect of modeling errors 163
 - 6.7.7 Effect of an inexact speed 168
- 6.8 Conclusion 168

- 7 Experimental validation: railway bridge in operation 171**
 - 7.1 Framework of the investigation 171
 - 7.2 Investigation object..... 173
 - 7.3 Measurement set-up..... 175
 - 7.3.1 Acceleration measurements 175
 - 7.3.2 Displacement measurements..... 176
 - 7.3.3 Axle detection 182
 - 7.4 Measurement results 184
 - 7.4.1 Modal analysis 184
 - 7.4.2 Train passages 186
 - 7.4.3 Resonance curves of accelerations 191
 - 7.4.4 Displacement measurements..... 197
 - 7.5 Structural model 201
 - 7.6 Force identification with real measurement data 207
 - 7.6.1 Computational parameters..... 207
 - 7.6.2 Weighting factors of the penalty functions 210
 - 7.6.3 Results and discussion of the experimental validation 210
 - 7.7 Conclusion 242

8 Experimental validation: pedestrian bridge	245
8.1 Framework of the investigation	245
8.2 Ground reaction forces: problem statement	245
8.3 Investigation object.....	248
8.4 Measurement set-up.....	250
8.5 Structural model	251
8.6 Force identification with real measurement data	257
8.6.1 Computational parameters.....	257
8.6.2 Weighting factors of the penalty functions	258
8.6.3 Preprocessing of the measurement data	260
8.6.4 Results and discussion of the experimental validation	263
8.7 Conclusion	271
9 Conclusions and outlook	273
9.1 Summary and conclusions	273
9.2 Outlook.....	278
Bibliography	281
Table of appendices	301
A Derivations of solutions for inverse problems	303
B Additional force identification results for the Schmutter bridge	307
