1	Introduction	1
1.1	Motivation	1
1.2	Pole Assignment	3
1.3	Computational Aspects of the Design	5
1.4	Layout	7
2	Polynomial Matrices and Related Operations	9
2.1	Introduction	9
2.2	Properties of Polynomial Matrices	9
2.2.1	Minimal Polynomial Bases	11
2.2.2	Properties of a Square Polynomial Matrix	14
2.3	Numerical Representation of Polynomial Matrices	15
2.4	Operations on the Numerical Representation of a Polynomial Matrix . . .	16
2.4.1	Introduction	16
2.4.2	Addition or Subtraction of Row Block-Matrices	17
2.4.3	Block-Transpose of a Block-Matrix	18
2.4.4	Resultant of a Polynomial Matrix	19
2.4.5	Multiplication of Polynomial Matrices	21
2.4.6	Synthesis of a Polynomial Block-Matrix Description of a Square Polynomial Matrix with Specified Properties	23

2.4.6.1	The Skeleton Block-Matrix of a Polynomial Matrix	26
2.4.6.2	A 'Standard' Structure Matrix and its Skeleton Block-Matrix	33
2.4.7	Construction of a Non-Singular Polynomial Matrix with a Specified Set of Eigenvalues	36
2.4.7.1	Summary	42
2.4.8	The Determinant of a Polynomial Matrix	42
2.4.8.1	Summary	48
2.4.9	Transforming a Full Row Rank Polynomial Matrix to its Row Proper Form	48
2.4.9.1	Summary	52
3	Model Descriptions and Transformations Between Models	53
3.1	Introduction	53
3.1.1	Mathematical Notation	54
3.2	Properties of the MFD	55
3.2.1	Introduction	55
3.2.2	Properties of the RMFD	56
3.2.3	Properties of the LMFD	60
3.3	Numerical Algorithms for the Transformation from SSD to MFD	63
3.3.1	Introduction	63
3.3.2	An Algorithm to Transform a SSD to RMFD	65
3.3.3	Summary	80
3.4	The Inverse of a Polynomial Matrix	80
3.4.1	Introduction	80
3.4.2	Computing the Adjoint of a Polynomial Matrix	81
3.4.3	Summary	85
3.5	Transforming a MFD to TFMD	86
3.5.1	Introduction	86

3.5.2	An Algorithm to transform a MFD to TFMD	86
3.5.3	Summary	88
3.6	The AutoRegressive-Moving Average Model	88
3.6.1	Introduction	88
3.6.2	Canonical Monic Form of ARMA Model	89
4	The Design of the Closed-Loop System Compensator	91
4.1	Introduction	91
4.2	The Closed-Loop System	93
4.2.1	The System Configuration	93
4.2.2	The Closed-Loop Transfer Function	95
4.3	The Output-Feedback Compensator	98
4.3.1	The Modified Left Compensator Equation	98
4.3.2	Solving the Modified Left Compensator Equation	101
4.3.2.1	Summary	116
4.4	The Pre-compensator	116
4.4.1	Introduction	116
4.4.2	The Alignment Error	117
4.4.3	The Following Error	120
4.4.4	The Following Error for a Continuous-Time System	120
4.4.5	The Following Error for a Discrete-Time System	123
4.4.6	Summary	125
4.5	Example of the Design Calculations	125
5	Design Examples	138
5.1	Introduction	138
5.2	The Chemical Reactor	139
5.3	The Pressurised Flow Box	147
5.4	The L-1011 Aircraft	154
5.5	The Flight Control System	165

6	Conclusions and Suggestions for Future Work	172
A	Proof: The Numerical Block-Matrix Multiplication of Two Conformable Polynomial Matrices	176
B	The Lower-Triangular Toeplitz Block-Matrix and its Inverse	178
B.1	Introduction	178
B.2	The Inverse of a Lower-Triangular Toeplitz Block-Matrix	180
C	Algorithm to Transform a Polynomial Matrix into a Regular Form	182
C.1	Introduction	182
C.2	Transformation of a Polynomial Matrix into a Regular Form by Post-Multiplication	185
C.3	Transformation of a Polynomial Matrix into a Regular Form by Pre-Multiplication	187
D	Pseudo-Inverse of a Resultant	189
E	Calculation of the Controllability Indices of a State-Space System	191
F	Symbols	193
	Bibliography	196
	Index	204
