Preface	XXV
---------------	-----

Part IV Introduction of quantities of division and transformation and their algebraic relations

1 The division values of doubly periodic functions and the special division equations	3
1.1 Group-theoretic foundations for the theory of elliptic functions	4
1.2 Intervening function-theoretic factors. Development of the fundamental problems of the theory of elliptic functions	6
1.3 Group-theoretic investigation of the n^{th} division values $f_{\lambda,\mu}$ of a doubly-periodic function of the first level	8
1.4 The division equations belonging to the division values $f_{\lambda,\mu}$	10
1.5 The algebraic character of the $f_{\lambda,\mu}$. Particular properties of the division values $\wp_{\lambda,\mu}$, $\wp'_{\lambda,\mu}$	11
1.6 Methods for the final determination of the coefficients $G(g_2, g_3)$. The absolute term of the division equation of the $\wp'_{\lambda,\mu}$	13
1.7 Norming the $\wp_{\lambda,\mu}$, $\wp'_{\lambda,\mu}$. Special considerations for $n = 3, 4, 5$	16
1.8 Introduction of the functions $\sigma_{\lambda,\mu}(u \mid \omega_1, \omega_2)$	19
1.9 Detailed group-theoretic investigation of the σ -division values	21
1.10 Function-theoretic study of the division values $\sigma_{\lambda,\mu}$	23
1.11 Special investigation of the $\sigma_{\lambda,\mu}$ for $n = 2$ and 3	25
1.12 Special study of the $\sigma_{\lambda,\mu}$ for $n = 5$ and 7 . Generalization	27
 2 The transformation of the n^{th} order, first level and the transformation equations of the first level	 31
2.1 First introduction of the transformation of the n^{th} order, first level and its group-theoretic investigation. The function-theoretic representatives	32
2.2 The transformation polygon of the n^{th} order	34
2.3 Second introduction of the transformation of the n^{th} order and first level. The arithmetic representatives	38

2.4	Relation between the function-theoretic and the arithmetic representatives. Extension of the transformation of the n^{th} order	39
2.5	Branching and genus of the transformation polygon of the n^{th} order . . .	42
2.6	Function-theoretic study of the transformation. The transformation equation	45
2.7	Continuation: the transformation equations for $J(\omega)$. Concept of the modular equation	46
2.8	Replacement of the modular equation for the orders belonging to the genus $p = 0$	49
2.9	Connection of the principal moduli τ with the transformed discriminant $\Delta(\omega_1, \omega_2)$	52
2.10	Collection of additional formulas for the transformed Δ	54
2.11	Additional remarks concerning the formulas found for the transformed Δ .	57
2.12	Introduction of the form-theoretic transformation equations adjoint to the first level	59
2.13	Fundamental theorems concerning the existence of the transformation equations adjoint to the first level in the cases $n = q$ and $n = q^2$	61
2.14	Form of the transformation equations for the roots of Δ	63
2.15	Historical notes concerning the transformation equations adjoint to the first level	66
3	General foundation for the transformation of the n^{th} order of arbitrary modular functions	69
3.1	General character of a transformed modular function	69
3.2	Group of the transformed modulus z' . Reducibility of the relation $f(z', J) = 0$	71
3.3	Excursus on a general principle of group theory: The case of distinguished subgroups	73
3.4	Continuation of the group-theoretic excursus: Case of non-distinguished subgroups	76
3.5	Disposal of the question of the conjugacy of the transformed moduli $z'(\omega)$	78
3.6	Generalities concerning the relation between z' and z . Exclusion of the non-congruence moduli	79
3.7	Investigation of the transformation equation for a congruence modulus of arbitrary level	81
3.8	Special study of the case $\nu = 1$. The modular equations of higher level . .	84
3.9	The representative system of the transformation of the n^{th} order belonging to the m^{th} level	85
3.10	A special theorem concerning the case of non-relatively prime m, n . Examples	88
3.11	Calculation of ω for a given modulus by means of a chain of transformations	90

4	Setting up the modular equations of higher levels with particular consideration of $m = 5$ and 16	95
4.1	Existence and number of the modular equations for the principal moduli to be studied	96
4.2	The permutability of the arguments in the left side of the modular equations	98
4.3	Foundation of the invariant-theoretic method for setting up the modular equations	102
4.4	The formation of the full form systems by polarization in the case of cogradiancy	106
4.5	The extent of the case of cogradiancy	108
4.6	Setting up the full form system for the modular equations of the icosahedron coming up for $m = 5$	111
4.7	Setting up the full form system for the modular equations of $\varphi(\omega)$ coming up for $m = 16$	114
4.8	Additional tools for the final determination of the modular equations. Historical notes	117
4.9	Collection of a few modular equations of the 5 th and 16 th level. Remark on non-congruence moduli	121
4.10	The irrational forms of the Jacobian modular equations, the modular correspondences and the relations between transformed ϑ -zeros	124
5	Application of the modular equations of the first level to the theory of integral binary quadratic forms	129
5.1	Supplementary theorems concerning the binary quadratic forms and their geometrical representation	130
5.2	Relation of the modular equations of the first level to the quadratic forms of positive determinant. The Smith Curve	133
5.3	Carrying over the Smith Curve to the n^{th} transformation polygon	135
5.4	Introduction of the singular moduli of the first level and n^{th} order and the modular functions $H_n(\omega)$ of first level	139
5.5	The relation of the singular moduli to the quadratic forms of negative determinant. Arithmetic determination of the degree of the equation $g_n(J) = 0$	142
5.6	Function-theoretic determination of the degree of the equation $g_n(J) = 0$. The class-relations of the first level	146
5.7	The singular moduli coming up for the proper transformation of the n^{th} order. Study of these in the transformation polygon $F_{\psi(n)}$	148
5.8	Historical material concerning the equation of the singular moduli properly belonging to the determinant $-\Delta$. The complex multiplication of elliptic functions	152
5.9	Specialization of the results up until now for $n = 5$ and $n = 7$	156
6	Application of icosahedral equations to the theory of integral binary quadratic forms	161

6.1	Relation of the modular equations of the fifth level to the binary quadratic forms of positive determinant	163
6.2	Transition to the class-number relations of the fifth level and initial steps for their calculations	165
6.3	Arithmetic enumeration of the zeros of $n(\omega)$ lying in the interior of F_{60} .	169
6.4	First part of the function-theoretic investigation of the $h_i(\omega)$ at the polygon cusps	173
6.5	Second part of the investigation of the $h_i(\omega)$ at the polygon cusps	177
6.6	Collection of the results of the investigations with respect to the polygon cusps	181
6.7	The system of class-number relations of the fifth level. The class-number relations of the third level	183

Part V Analytic treatment of the function-theoretic fundamental problem for the congruence groups

1	Introduction to the theory of elliptic normal curves C_n of the n^{th} order	189
1.1	The definition of the elliptic normal curve of the n^{th} order and its single-valued transformations into itself	190
1.2	Geometrical deductions concerning the normal curves C_n by means of the method of projecting	194
1.3	The canonical coordinate system of the C_3 and its generalization for the C_n	196
1.4	The singular coordinate system for the normal curve C_3 . Initial introduction of the quantities X_α	200
1.5	Representation of the X_α coming up for the C_3 by means of σ -projects and transformed σ	202
1.6	Introduction of the singular coordinate polyhedron of the X_α for the elliptic normal curve C_n of arbitrary order	204
1.7	Preliminary normalization of the X_α . Expression of the collineation group G_{2n^2} by means of the X_α	207
1.8	Series developments for the functions $X_\alpha(u \omega_1, \omega_2)$ for arbitrary n	211
1.9	Setting up the $\frac{n(n-3)}{2}$ linearly independent quadratic relations, subsisting between the general X_α	213
1.10	Interpretation of problems from the division and transformation theory by means of the normal curves	215
2	The quantities X_α considered as functions of the periods ω_1, ω_2	217
2.1	Final choice and representations for the additional factor κ of the $X_\alpha(u \omega_1, \omega_2)$ in the case of an odd n	218
2.2	Representations of the normalized $X_\alpha(u \omega_1, \omega_2)$ and determination of its level in the case of an odd n	220
2.3	The modular forms z_α, y_α , etc. of the n^{th} level and their relation to the division values in the case of an odd n	223

2.4	Final choice and representation for the additional factor κ of the $X_\alpha(u \omega_1, \omega_2)$ in the case of an odd n	226
2.5	Representations of the normalized $X_\alpha(u \omega_1, \omega_2)$ and determination of their level in the case of odd n	228
2.6	Introduction of the modular forms z_α, y_α , etc. of the $2n^{\text{th}}$ resp. $4n^{\text{th}}$ levels for even values of n	230
2.7	Transformation of the X_α by modular substitutions, in particular, by S and T , in the case of an odd n	231
2.8	Effect of the substitutions S, T on the X_α for even n . General remark on the additional factor κ	236
2.9	Connection to the previous chapter. Final form of the X_α -group for the case of a prime number $n = q$	238
2.10	Excursus on the sums of Gauss	241
2.11	Isomorphic mapping of the X_α -group onto itself by the replacement of ε by ε^p	246
2.12	The substitution groups of the modular forms z_α, y_α and the biquadratic relations of the z_α coming up for odd n	248
3	Formation of new functions of the n^{th} level by means of bilinear combinations of the X_α	251
3.1	The two- and three-termed bilinear combinations B_α of the X_α	253
3.2	The three kinds I, II, III of p -termed bilinear combinations $B_\alpha^{(p,n)}$ of the X_α	256
3.3	Analytic developments for the modular forms A_α for odd n prime to 3 .	261
3.4	Analytic representation and manifoldness of the $B_\alpha^{(p,n)}$ entering in case I. Introduction to the $\mathbf{X}_\alpha(u, v)$	264
3.5	Analytic representations of the B_α resp. $\mathbf{X}_\alpha(u, v)$ coming up in the cases II, III	268
3.6	Investigation of the quadratic forms of $f(\xi, \eta)$ entering in the cases II and III and their relative equivalence	270
3.7	The manifoldness of the function systems $\mathbf{X}_\alpha(u, v)$ coming up in case II	274
3.8	Manifoldness of the function systems $\mathbf{X}_\alpha(u, v)$ arising in case III	277
3.9	The modular forms $A_\alpha, z_\alpha, y_\alpha, x_\alpha, \dots$ of the n^{th} level, which arise from the general $\mathbf{X}_\alpha(u, v)$	279
3.10	Series developments for the modular forms $A_\alpha, z_\alpha, y_\alpha$ etc. in case I	281
3.11	Series developments of the moduli A_α , etc. in the cases II and III. Rearrangement according to ascending powers of r	284
4	Form-theoretic-analytic discussions in the domain of the lowest level numbers	287
4.1	Principles for the study of integral algebraic modular forms	288
4.2	Integral modular forms of the second level and their laws of formation .	290
4.3	The integral modular forms ξ_2, ξ_4 and $\sqrt[3]{\Delta}$ of the third level. Relation of these to the division values $\wp_{\lambda, \mu}, \wp'_{\lambda, \mu}$	293
4.4	The modular forms $\sqrt[6]{\Delta}, y_\alpha$ adjoint to the third level. Second representation of the principal modulus $\xi(\omega)$	297

4.5	The integral modular forms of the fourth level. Representation for $\sqrt[4]{\Delta}$ and the Galois principal modulus $\mu(\omega)$	299
4.6	The two digradient binary systems z_α of the dimension -2 for $n = 5$...	302
4.7	Analytic laws of formation for the Galois principal modulus $\zeta(\omega)$. Reduction of the η_α to the ζ_α	305
4.8	Form-theoretic form of the resolvent of the fifth degree of the icosahedral equation. Relation to the principal modulus τ of the subgroup Γ_5	307
4.9	The ternary modular system of the fifth level of the A_α	309
4.10	Analytic representations for the simplest modular functions $y(\omega)$ and $x(\omega)$ of the sixth level	311
4.11	Analytic representations for the systems of the z_α and A_α of the seventh level considered in Vol. I	312
4.12	The quaternary modular system of the B_α for $n = 7$	315
5	The modular systems of the eleventh level and the associated resolvents of eleventh and twelfth degrees	321
5.1	Introduction of the three modular systems z_α of $(-2)^{\text{nd}}$ dimension	322
5.2	Setting-up of the algebraic relations between the z_α . Special consideration of the $z_\alpha^{(1)}$	325
5.3	The invariant combinations of the z_α belonging to the G_{660} and their relation to the modular forms g_2, g_3, Δ of the first level	328
5.4	The geometrical models of the 20^{th} , 80^{th} and 50^{th} degrees in the space R_4 , which correspond to the three z_α -systems	331
5.5	Intersection of the curves C_{20}, C_{80} and the ruled surface with the spaces $\Phi(\zeta) = 0$ and $\Psi(\zeta) = 0$	333
5.6	Choice of a special subgroup G_{60} of G_{660} , and investigation of the polygon F_{11} belonging to the G_{60}	335
5.7	The simplest modular forms and the principal modulus of the Γ_{11} chosen	338
5.8	The two resolvents of eleventh degree in function-theoretic and form-theoretic form	341
5.9	The transformation polygon of eleventh order of genus $p = 1$	344
5.10	The two single-valued forms A, B , adjoint to the polygon F_{12} , and the two-valued function $\tau(\omega)$	346
5.11	The three-valued quantities $E(\omega_1, \omega_2)$ and $\tau'(\omega)$ belonging to the polygon F_{12} . Relation between $\tau(\omega)$ and $\tau'(\omega)$	348
5.12	Representation of $g_2, g_3, \sqrt{\Delta}$ and their transformed values $g'_2, g'_3, \sqrt{\Delta'}$ in E, A, B . Expression for the function-theoretic resolvent of 12^{th} degree	350
5.13	The form-theoretic resolvent of twelfth degree	354
6	The algebraic models for $n > 11$ defined by the modular equations of the first level	357
6.1	The transformation polygon belonging to $n = 31$ and its modular forms of the dimension -1 and -2	358

6.2	The full modular system of the Γ_{32} . The singular moduli and the Smith's curve of the transformation polygon F_{32}	360
6.3	The modular forms Z, H of the Γ_{32} . Representation of Δ, g_2 and J in the moduli of Γ_{32}	363
6.4	The surface F_{48} belonging to $n = 35$ and its simplest modular system. . .	366
6.5	Representation of the principal moduli of the groups Γ_8 and Γ_6 belonging to $n = 7$ and 5 by the moduli of the Γ_{48} belonging to $n = 35$..	370
6.6	The transformation polygon F_{48} belonging to $n = 47$ and its modular forms of the $(-1)^{\text{st}}$ and $(-2)^{\text{nd}}$ dimension	372
6.7	The full modular system of the Γ_{48} and the associated hyperelliptic relation of the tenth degree	374
6.8	Foundation for the transformation of the order $n = 71$	377

Part VI Theory of the modular correspondences and the class-number relations proceeding from them

1	New discussions of Riemann's theory of algebraic functions	383
1.1	Introduction of the integrals $Q_{\xi, \eta}^{x, y}$ of the third kind and, in particular, the normal integrals $\Pi_{\xi, \eta}^{x, y}$	384
1.2	Periods of the normal integrals $\Pi_{\xi, \eta}^{x, y}$. Theorem of the permutability of parameter and argument for $\Pi_{\xi, \eta}^{x, y}$	386
1.3	The Abelian theorem, in particular for the integrals of the first and second kinds	388
1.4	Foundations of the form-theoretic method of consideration. Historical notes.	390
1.5	The algebraic forms, in particular, the integral algebraic forms $G(z_1, z_2)$ of the surface F_n	391
1.6	Representation of all integral forms $G(z_1, z_2)$ by means of a few of them. Theorem of the minimal basis.	394
1.7	Form-theoretic representations of the integrals of the surface F_n	397
1.8	Announcements concerning the form theory to be based on a plane curve.	400
1.9	The prime form $P(x, y)$ and its fundamental properties	404
1.10	Continuation: periodicity properties of the prime form. Its relation to the ϑ -function	407
1.11	Representation of the algebraic functions and integrals of the F_n by the prime form	410
1.12	The inversion problem and its solution	412
2	General theory of algebraic correspondences and the correspondence principle	417
2.1	The correspondences and the correspondence principle of the geometers	418
2.2	The general approach. The fundamental relations between the integrals j , as well as between the periods τ_{ik}	421

2.3	The totality of the algebraic models of the genus p	423
2.4	The singular Riemann surfaces. Division of the correspondences into singular and ordinary	426
2.5	Representation of the valenced correspondences by the prime form. Derivation of the Cayley-Brill correspondence formula	429
2.6	The arithmetic foundation of the general correspondence theory	432
2.7	Formation of a minimal basis for all solution systems (π) of the surface F_n	435
2.8	Actual existence of all arithmetically possible correspondences. Choice of a minimal basis $[K_\epsilon]$ of t correspondences of the F_n	438
2.9	Representation of all correspondences of the F_n by means of the minimal basis $[K_\epsilon]$. The general correspondence formula	441
2.10	Riemann surfaces with single-valued transformations into themselves	444
3	Theory of the integrals of the first kind for the congruence groups of prime level	447
3.1	The form theory of a surface F_μ on the basis of ω_1, ω_2	448
3.2	The modular forms of the first and third kinds in particular. Preliminary choice of the integrals j for a prime level q	451
3.3	Particularities concerning the integral $j(\omega 0)$ of the division polygon. Representation of these by the $j(\omega \alpha), j(\omega \beta)$	454
3.4	A general law of formation for the integrals $j(\omega \alpha), j(\omega \beta)$ of the q^{th} level	459
3.5	The principal of the integral development coefficients for the integrals $j(\omega \alpha), j(\omega \beta)$	462
3.6	Introduction of the development functions $\psi(m)$ and $\chi(m)$. Minimal bases of integrals $j(\omega \alpha), j(\omega \beta)$	464
3.7	Arithmetic definition of the $\psi_1(m)$ for $q = 7$ and $q = 11$. The general binary development principle	467
3.8	The remaining development functions ψ_i, χ_k of the eleventh level. The general quaternary development principle	469
3.9	Presentation of a few results concerning the integrals of the lower composite level numbers	472
3.10	Further questions concerning the integrals of the first kind	475
4	Special theory of the modular correspondences of n^{th} order of an arbitrary level	479
4.1	Definition of the modular correspondences of the n^{th} order. Irreducibility, invertibility and monodromy groups	480
4.2	The integral equation for the modular correspondences of the sixth level	482
4.3	The integral relations for the modular correspondences of the seventh level	484
4.4	Presentation of the integral relations for the correspondences belonging to the Γ_{96} of the eighth level	487
4.5	Prime form representation and coincidence number of the modular correspondences in the case of a single development function, explained for $q = 7$	488

4.6	Approach for the integral relations of the $j(\omega \alpha)$, $j(\omega \beta)$ for the modular correspondences of an arbitrary prime level q	491
4.7	Actual setting-up of the integral relations for $q = 11$	495
4.8	Preliminary remarks on the choice of a basis of correspondences for an arbitrary prime level q	497
4.9	Formation of a basis of correspondences for the case of a quadratic residue n	499
4.10	Formation of a basis of correspondences for the case of a non-residue n of q	503
4.11	Representation of modular correspondences of the q^{th} level by the prime form in the λ resp. μ correspondences of the basis	504
4.12	Enumeration of the coincidences for the modular correspondences of the q^{th} level	506
5	The Class-number relations of an arbitrary prime level, with particular effectuations for $q = 7$ and 11	511
5.1	Preparatory theorems for the arithmetic determination of the coincidence numbers $v_i(n)$	512
5.2	Enumeration of the zeros of $h(\omega)$ in the polygon interior. Case distinctions I, II, III to be made	516
5.3	Continuation: discussion of the cases I, II, III	518
5.4	Proof of the lemma on the number of incongruent solutions of a congruence of the second degree	520
5.5	Enumeration of the zeros of $h(\omega)$ lying at the polygon cusps	522
5.6	Putting together the results concerning the number $v(n)$. The special case $n = 1$	526
5.7	The two systems of class-number relations of the 7^{th} level	529
5.8	General approach for the class-number relation of the q^{th} level	531
5.9	Final form of the two systems of the class-number relations of the eleventh level	534
6	The algebraic representation of the modular correspondences	537
6.1	Representation of an algebraic function of two surface points x, y by algebraic functions of x or y alone	538
6.2	The representation of the algebraic correspondences by algebraic equations	541
6.3	The arbitrariness of the equation entering in the case of a non-negative valence	544
6.4	Choice of the three classes of modular correspondences to be especially treated in the following	546
6.5	Separation of the zero valenced correspondences for the groups Γ_{168} , Γ_{96} and Γ_{384}	548
6.6	Generalities concerning intersection-system correspondences. Separation of those for the curves C_4 and C_8 of the groups Γ_{96} , Γ_{384}	551
6.7	Separation of the intersection-system correspondences for the C_4 of the group Γ_{168}	553

6.8	Invariant-theoretic tools for the construction of the correspondence equations	555
6.9	Setting up a few biternary invariants for the G_{168} of the seventh level ...	557
6.10	Final calculation of the correspondence equations of the seventh level for $n = 3, 6, 19, 12$	560
6.11	Disclosure of a few correspondence equations for the groups Γ_{96} and Γ_{384}	561
