

TABLE OF CONTENTS

I. INTUITIONISTIC FORMAL SYSTEMS (A.S. Troelstra)

§ 1	<u>Intuitionistic logic</u>	1
	Notational conventions (1.1.2) - Spector's system (1.1.3) - - Gödel's system (1.1.4) - Equivalence of Spector's and Gödel's system (1.1.5) - Equivalence of Spector's and Kleene's formalization (1.1.6) - A natural deduction system (1.1.7 - 1.1.9) - Deduction theorem for Spector's system (1.1.9 - 1.1.10) - Equivalence between natural deduction and Spector's system (1.1.11)	
§ 2	<u>Conservative and definitional extensions, expansions</u>	14
	Definition of predicate logic with equality (1.2.1) - Definition of conservative extension (1.2.2) - - Expansion (1.2.3) - Definitional extension (1.2.4) - - Addition of symbols for definable predicates (1.2.6) - - Addition of symbols for definable functions (1.2.7) - - Replacement of function symbols by predicate symbols (1.2.8) - Addition of defined sorts of variables (1.2.9 - - 1.2.10)	
§ 3	<u>Intuitionistic first-order arithmetic</u>	18
	Language of \underline{HA} (1.3.2) - Axioms and rules of \underline{HA} (1.3.3) - Defining axioms for primitive recursive functions (1.3.4) - Rule and axiom schema of induction (1.3.5) - Natural deduction variant of \underline{HA} (1.3.6) - Eliminability of disjunction in systems containing arithmetic (1.3.7) - - Formulation of \underline{HA} without function symbols (1.3.8) - - Notational conventions (pairing, coding of finite sequences, proof predicates, gödelnumbers, gödel- and rossersentences, numerals) (1.3.9) - Formalization of elementary recursion theory (1.3.10)	
§ 4	<u>Inductive definitions in \underline{HA}</u>	28
	Definition of class Γ (1.4.2) - Normal form for elements of Γ (1.4.3 - 1.4.4) - Explicit definability of predicates introduced as closed under a condition from Γ (1.4.5)	
§ 5	<u>Partial reflection principles</u>	33
	Gödelnumbering of function constants and terms (1.5.2) - - Evaluation of closed terms (1.5.3) - Construction of partial truth definitions (1.5.4) - Partial reflection principles (1.5.5 - 1.5.6) - Remark on refinements (1.5.7) - - Remark on quantifier-free systems (1.5.8) - Reflection principle for $qf - \underline{HA}$ (1.5.9 - 1.5.10).	
§ 6	<u>Intuitionistic arithmetic in all finite types</u>	39
	Type structure \underline{T} (1.6.2) - Description of $\underline{N} - \underline{HA}^w$ (1.6.3 - 1.6.7) - Definition of the λ -operator (1.6.8) - - \underline{HA} as a subsystem of $\underline{N} - \underline{HA}^w$ (1.6.9) - Intensional identity or equality (1.6.10) - Description of $\underline{I} - \underline{HA}^w$ (1.6.11) - Description of $\underline{E} - \underline{HA}^w$, $\underline{WE} - \underline{HA}^w$ (1.6.12) - - Description of $qf - \underline{N} - \underline{HA}^w$, $qf - \underline{I} - \underline{HA}^w$, $qf - \underline{WE} - \underline{HA}^w$ (1.6.13) - $qf - \underline{I} - \underline{HA}^w$, $qf - \underline{WE} - \underline{HA}^w$ as equational calculi (1.6.14) - The systems \underline{HA}^w , $qf - \underline{HA}^w$ (1.6.15) -	

- Simultaneous recursion and pairing; a comparison of various treatments (1.6.16) - Pairing operators in $qf - \underline{WE} - \underline{HA}^w$ (1.6.17) - Historical notes, variants in the literature (1.6.18)

§ 7 Induction and simultaneous recursion

Simultaneous recursion in $qf - \underline{N} - \underline{HA}^w$ (1.7.2 - 1.7.7) -
 - The induction lemma for $qf - \underline{N} - \underline{HA}^w$ (1.7.8 - 1.7.10) -
 - Replacement of recursor by iterator (1.7.11) -
 - Simultaneous recursion and the induction lemma in $qf - \underline{HA}^w$ (1.7.12)

§ 8 More about $\underline{N} - \underline{HA}^w$

Cartesian product types and pairing operators (1.8.2) -
 - The λ -operator as a primitive notion (1.8.4) -
 - Reduction to pure types (1.8.5 - 1.8.8) - Reduction to numerical types in $qf - \underline{WE} - \underline{HA}^w$ (1.8.9)

§ 9 Extensions of arithmetic

Extensions of arithmetic expressed in $\mathcal{L}(\underline{HA})$ or $\mathcal{L}(\underline{HA})$ extended by relation constants (reflection principles, generalized inductive definitions) (1.9.2) - Language of \underline{HAS}_0 (1.9.3) - Comprehension principles (1.9.4) -
 - Extensionality (1.9.5 - 1.9.7) - $\underline{HAS}_0 + \text{EXT} + \text{ACA}$ is conservative over \underline{HA} (1.9.8) - Formulation of \underline{HAS} with λ -terms (1.9.9) - Description of \underline{EL} (1.9.10) - Some notations and conventions (1.9.11) - Formalization of elementary recursion theory in \underline{EL} (1.9.12 - 1.9.16) -
 - Definitions of Λ^0x , Λ^1x , $\Lambda^0\alpha$, $\Lambda^1\alpha$ (1.9.17) - Systems of intuitionistic analysis based on the concept of a lawlike sequence; \underline{IDB} (1.9.18) - Systems of intuitionistic analysis based on a concept of choice sequence (1.9.19) - Bar induction (1.9.20) - Extended bar induction (1.9.21 - 1.9.23) - Fan theorem (1.9.24) - Extensions of $\underline{N} - \underline{HA}^w : \underline{IDB}^w$ (1.9.25) - Theories with bar recursion of higher type: $\underline{N} - \underline{HA}^w + \text{BR}$ (1.9.26) - Girard's theory of functionals (1.9.27)

§ 10 Relations between classical and intuitionistic systems : translation into the negative fragment

Definition of the mapping ' (1.10.2) - Definition of Harrop formula, and strictly positive part (s.p.p.) (1.10.5) - Definition of negative formula (1.10.6) -
 - Properties of the mapping ' (1.10.9 - 1.10.13)

§ 11 General discussion of various schemata and proof-theoretic closure conditions

Definition of admissible rule, and intended intuitionistic interpretation of the logical constants (1.11.1) - Disjunction and explicit definability property (1.11.2) -
 - The schema $\forall x(A \vee Bx) \rightarrow A \vee \forall xBx$ (1.11.3) - The schema $\forall x \neg A \rightarrow \neg \forall xA$ (1.11.4) - Markov's schema and rule (1.11.5) - Independence of premiss schemata and rules (1.11.6) - Church's thesis and rule (1.11.7).

II. MODELS AND COMPUTABILITY (A.S. Troelstra)

- § 1 Definitions by induction over the type structure 97
 Definition over the type structure (applicative set, type level) (2.1.1) - Establishing properties for applicative sets of terms (2.1.2) - Definability aspects (2.1.3) - Sets of terms closed under λ -abstraction (2.1.4)
- § 2 Computability of terms in \underline{N} - \underline{HA}^w 100
 Definition of reduction and standard reduction for terms of \underline{N} - \underline{HA}^w (2.2.2) - Comparison of standard and strict reduction (2.2.3) - Alternative definition of \geq (2.2.4) - Definition of computability, strict -, standard - (2.2.5) - All terms of \underline{N} - \underline{HA}^w are standard computable (2.2.6-9) - \underline{N} - \underline{HA}^w conservative over its induction-free part for equations between closed terms (2.2.10) - Strong computability and strong normalization (2.2.12-19) - Uniqueness of normal form (2.2.20-29) - Computability and strong computability for λ -based theories (2.2.30-34) - Discussion and comparison of proofs of computability for terms of \underline{HA}^w in the literature (2.2.35)
- § 3 More about computability 116
 Computability in \underline{I} - $\underline{HA}^w + IE_0$ (2.3.1-5) - The equality axioms IE_1 (2.3.6) - Standard computability of terms in languages with Cartesian product type (2.3.7) - Computability relative to assignment of functions (2.3.8-10) - Arithmetization of computability (2.3.11-13)
- § 4 Models based on partial recursive function application: 123
 HRO, HEO
 Models: normal, extensional models (2.4.1) - Submodel, homomorphism, embedding (2.4.3) - Construction of inner extensional models from arbitrary models of \underline{N} - \underline{HA}^w (2.4.5) - The set-theoretical model of \underline{E} - \underline{HA}^w (2.4.6) - Description of HRO (2.4.8) - The formal theories \underline{HRO} , \underline{HRO}^- (2.4.10) - Description of HEO (2.4.11) - HEO and the inner extensional model of HRO are different (2.4.12) - Provable faithfulness of HRO, uniformly in type 0 variables (2.4.13-14) - Closed type 1 terms of \underline{N} - \underline{HA}^w are \underline{HA} provably recursive (2.4.15) - Sketch of a variant of HRO satisfying $\beta\eta$ -conversion (2.4.18) - Pairing in HRO, HEO (2.4.19)
- § 5 Term models of \underline{N} - \underline{HA}^w 132
 Definition of CTM, CTNF, CTM', CTNF' (2.5.1-2) - Some properties of CTM, CTNF, CTM', CTNF' (2.5.3) - CTNF' is isomorphic to a submodel of HRO for a suitable version of HRO (2.5.5) - Alternative proof of uniqueness of normal form (2.5.6) - HRO can be made into a model for \underline{I} - $\underline{HA}^w + IE_1$ (2.5.8) - Examples of versions of HRO where distinct normal terms are represented by the same element (2.5.9) - IE_0 is weaker than IE_1 (2.5.10)
- § 6 Models based on continuous function application: ICF, ECF 138
 Definition of ICF(\mathcal{U}) (2.6.2) - In ICF a modulus-of-continuity functional exists (2.6.3) - ICF(\mathcal{U}) contains a fan-functional if \mathcal{U} satisfies FAN (2.6.4) - Hereditarily continuous functionals ECF(\mathcal{U}) (2.6.5) - ECF(\mathcal{U}) contains a fan-functional if \mathcal{U} satisfies FAN (2.6.6) - ECF does not contain a modulus of continuity

functional (2.6.7) - A recursively well-founded, but not well-founded tree (2.6.9) - Provable faithfulness of ICF uniformly in type 1 variables (2.6.11-12) - The equivalence between ECF(\mathcal{R}) and HRO (2.6.13-24) - KLS holds in $\text{HA} + \text{M}_{\text{PR}}$ (2.6.15-17) - Basis theorem (2.6.19) - $\text{QF-AC}_{\sigma, \tau}$ holds for ECF (2.6.20) - The models $\text{ECF}^{\text{r}}(\mathcal{U})$ and $\text{ICF}^{\text{r}}(\mathcal{U})$ (2.6.22) - A variant of ICF and ECF (2.6.23) - Pairing operators in ICF, ECF, ICF^* , ECF^*

- § 7 Extensionality and continuity in $\underline{\text{N-HA}}^{\omega}$ 155
 Extensionality and hereditary extensionality (2.7.2-4) -
 - Derived rules of extensionality (2.7.5) - Counterexample to the rule of extensionality when variables of type level > 1 are present (2.7.6) - Closed type 3 terms of $\underline{\text{N-HA}}^{\omega}$ are not extensional in every model (2.7.7) - Provable modulus of continuity for type 2 terms of $\underline{\text{N-HA}}^{\omega}$ (2.7.8) - Product topology (2.7.9) - "Floating product topology" (2.7.10)
- § 8 Other models of $\underline{\text{N-HA}}^{\omega}$ 162
 The schemata S1-S9 (2.8.2-2.8.4) - Scarpellini's models (2.8.5) - Compact and hereditarily majorizable functionals (2.8.6)
- § 9 Computability and models for extensions of $\underline{\text{N-HA}}^{\omega}$ 166
 Extension of computability to functionals of $\underline{\text{N-IDB}}^{\omega}$ and related theories (2.9.2) - Computability for bar-recursive functionals (2.9.3) - Computability for Girard's system of functionals (2.9.4) - Extensions of HRO, HEO to models for other systems (2.9.5) - Application of K-HRO: Computability of closed terms of $\underline{\text{N-IDB}}^{\omega}$ (2.9.6) - Extension of HRO, HEO to Girard's system of functionals (2.9.7) - Similarly for ICF, ECF (2.9.8) - Models for $\underline{\text{N-HA}}^{\omega} + \text{BR}$ (2.9.9-12).

III. REALIZABILITY AND FUNCTIONAL INTERPRETATIONS (A.S. Troelstra)

- § 1 A theme with variations: Kleene's $\Gamma|C$ 175
 Definition of $\Gamma|C$ (3.1.2) - Soundness theorem (3.1.4) -
 - Existence and disjunction under implication (3.1.5) -
 IPR^c for $\underline{\text{HA}}$ (3.1.7) - Characterization of $C|C$ by deducibility conditions (3.1.8) - $C|C$ respects logical equivalence, and $C|C$ holds for Harrop formulae (3.1.9) -
 - $C|C$ holds also for formulae which are not equivalent to a Harrop formula (3.1.10) - IP_0^c is not derivable in $\underline{\text{HA}}$ (3.1.11) - Disjunction and explicit definability property for $\underline{\text{HA}} + \text{M}_{\text{PR}}$ (3.1.12) - A variant of $\Gamma|C$ (3.1.13) -
 - IPR for $\underline{\text{HA}}$ (3.1.15) - A method of dealing with variables using partial reflection principles (3.1.16) -
 - Closure under Church's rule (3.1.18) - Extension and generalization of $\Gamma|C$ to higher-order systems (3.1.19) -
 - $\Gamma|C$ for $\underline{\text{HAS}}_0 + \text{PCA}$, with applications (3.1.20) -
 - Extension to $\underline{\text{HAS}}$ (3.1.21-23) - Extension of Moschovakis's methods to $\underline{\text{IDB}}$, $\underline{\text{IDB}}_1$ (3.1.24)

- § 2 Realizability notions based on partial recursive function application 188
- Definition of \mathbf{rp} -realizability (3.2.2) - Examples (3.2.4) - Soundness theorem (3.2.4) - Analysis of \mathbf{r} -realizability (3.2.9-19) - The rôle of almost negative formulae (3.2.9-3.2.13) - The schema \mathbf{ECT}_0 (3.2.14-15) - Idempotency of realizability (3.2.16) - Characterization of \mathbf{HA} - \mathbf{r} -realizability (3.2.18-19) - Corollaries (3.2.20) - Realizability for Markov's schema (3.2.21-22) - Realizability for $\mathbf{TI}(<)$ (3.2.23-24) - Characterization of \mathbf{HA}^c - \mathbf{r} -realizability (3.2.25) - Realizability of \mathbf{IP}_0 (3.2.26) - \mathbf{IP} is not realizable (3.2.27-28) - Extensions to other systems (3.2.29) - Realizability for \mathbf{IDB} (3.2.30) - $\mathbf{HAS} + \mathbf{CT}_0 + \mathbf{UP}$ is consistent relative to \mathbf{HAS} (3.2.31) - Some generalizations (3.2.32) - Comparison of \mathbf{q} -realizability with \mathbf{r} -realizability (3.2.33)
- § 3 Realizability notions based on continuous function application 206
- Definition of \mathbf{rp}^1 -realizability (3.3.2) - Soundness (3.3.3) - Special instances of soundness (3.3.4) - Soundness for \mathbf{IDB} (3.3.6) - The generalized continuity schema \mathbf{GC} (3.3.9) - Characterization of \mathbf{r}^1 -realizability (3.3.13)
- § 4 Modified realizability 213
- Definition of \mathbf{mrp} -realizability (3.4.2) - Examples (3.4.3) - Soundness theorem (3.4.5) - Characterization of \mathbf{mr} -realizability (3.4.7-8) - Inessential (but convenient) variants of \mathbf{mr} -realizability (3.4.9) - Comparison of \mathbf{HRO} - \mathbf{mr} -realizability and \mathbf{r} -realizability (3.4.11) - \mathbf{mr} -realizability and non-realizability of various schemata (3.4.12-25) - \mathbf{mr} -realizability of \mathbf{MPR} , \mathbf{CT} , \mathbf{CT}_0 (3.4.12-13) - $\mathbf{HA} + \mathbf{CT}_0 \not\models \mathbf{ECT}_0$ (3.4.14) - \mathbf{WCT} is \mathbf{ICF}^T - \mathbf{mr} -realizable (3.4.15) - \mathbf{mr} -realizability of \mathbf{FAN} and $\mathbf{WC-N}$ (3.4.16-19) - \mathbf{mr} -realizability of \mathbf{BI}_M (3.4.20-21) - \mathbf{mr} -realizability of $\mathbf{HA} + \mathbf{TI}(<)$ (3.4.22-25) - Modified realizability for \mathbf{HAS} (3.4.27-28) - Characterization of provably recursive functions (3.4.29)
- § 5 The Dialectica interpretation and translation 230
- Definition of the Dialectica translation (3.5.2) - Motivation (3.5.3) - Soundness theorem (3.5.4) - $\mathbf{N-HA}^w$ is not Dialectica interpretable in itself; decidability of prime formulae (3.5.6) - Axiomatization of Dialectica interpretability (3.5.7-11) - The interpretability of the extensionality axiom (3.5.12-15) - Dialectica interpretability of \mathbf{CT} , \mathbf{CT}_0 , $\mathbf{C-N}$, \mathbf{FAN} , \mathbf{IP} (3.5.16) - The Diller-Nahm variant of the Dialectica interpretation (3.5.17) - Shoenfield's variant (3.5.18) - Extending the Dialectica interpretation to stronger systems (3.5.19-21) - Church's thesis and bar recursion (3.5.20) - Girard's extension (3.5.21)
- § 6 Applications: consistency and conservative extension results 250
- Conservative extension results (3.6.2-9) - Axioms of choice for \mathbf{HRO} , \mathbf{HEO} (3.6.10-16) - Extensions to analysis (3.6.17-20)

- § 8 Markov's schema and Markov's rule 263
 Forms of Markov's schema and rule (3.8.1) - Not all negations of almost negative formulae are negative (3.8.2) - $\text{HA} + \neg \text{MPR}$ is consistent and closed under MPPR (3.8.3) - Characterization of MPR (3.8.4) -
 - Validity of MR^w , MR in various systems (3.8.5) -
 - HA and HA^c have the same provably recursive functions (3.8.6) - M , MR for systems stronger than arithmetic (3.8.7)
- § 9 Applications of p - realizability 267
 Definition of p - realizability (3.9.2) - Soundness theorem (3.9.4)^s - $\text{HA} \not\vdash \text{KLS}_1$ (3.9.5 - 12) - Some other results on KLS and the corresponding rules (3.9.12).

IV. NORMALIZATION THEOREMS FOR SYSTEMS OF NATURAL DEDUCTION (A.S. Troelstra)

- § 1 The strong normalization theorem for HA 275
 Notational conventions about proof trees (4.1.2) -
 - Description of the reduction processes (4.1.3) -
 - Definitions of thread, segment, maximal segment, normal form, strictly normal form, reduction sequence, reduction tree (4.1.4) - Remarks on reductions, normal deductions (4.1.6) - Strong normalization for HA (4.1.7 - 18) - Definition of strong validity (4.1.9) - Each strongly valid deduction has a finite reduction tree (4.1.13) - Definition of strong validity under substitution (4.1.15) - All deductions are strongly valid under substitution (4.1.16 - 17) - Uniqueness of normal form of deductions (4.1.19 - 24)
- § 2 Applications of the normalization theorem 299
 Definition of path and spine (4.2.2 - 3) - Structure of path and spine in normal deductions (4.2.4 - 8) - Disjunction and explicit definability property (4.2.9 - 12) -
 - The rule IPR without parameters (4.2.13) - Markov's rule MR_{PR} (4.2.14) - Disjunction and explicit definability property for $\text{HA} + \text{MPR}$ (4.2.15 - 17) - Conservative extensions over quantifier-free fragments (4.2.18 - 19) - Reflection principle for closed Σ_1^0 -formulae (4.2.20)
- § 3 Normalization for $\text{HA} + \text{IP}$ with applications 307
 Strong normalization for $\text{HA} + \text{IP}$ (4.3.1 - 2) - Definition of spine (4.3.3) - Structure of spine in normal deductions (4.3.4 - 5) - Disjunction and explicit definability property for $\text{HA} + \text{IP}$ (4.3.6)
- § 4 Formalization of the normalization theorem, with applications 311
 Formal definition of strong validity (4.4.2) - Theorem on arithmetization of normalization (4.4.3) - Closure under IPR with parameters (4.4.5) - Closure under Church's rule (4.4.6)

§ 5	<u>Normalization for second order logic and arithmetic</u> The system $M_0(S)$ (4.5.2) - Formalizing the proof of the normalization theorem (4.5.3) - Construction of a satisfaction relation (4.5.4-6) - Properties of the satisfaction relation (4.5.7-9) - Partial reflection principle (4.5.10) - Applications (4.5.11) - <u>HAS</u> is closed under a rule of choice from numbers to species (4.5.12).	315
V. APPLICATIONS OF KRIPKE MODELS (C.A. Smorynski)		
§ 1	<u>Kripke models</u> Discussion (5.1.1) - Definition of Kripke models (5.1.2.) - - Some basic properties of Kripke models (5.1.3) - Examples (5.1.4) - The completeness theorem (5.1.5-11) - - The Aczel slash (5.1.12-18) - The operation $() \rightarrow (\Sigma)'$ (5.1.19-21) - Models with equality (5.1.22-23) - Function symbols (5.1.24) - Intuitionism? (5.1.26)	324
§ 2	<u>The treatment of Heyting's arithmetic</u> The class of models of <u>HA</u> is closed under the operation $() \rightarrow (\Sigma)'$; disjunction and explicit definability property (5.2.1-4) - Applications of the operation $() \rightarrow (\Sigma)'$ (5.2.5-8) - Formulae preserved under $() \rightarrow (\Sigma)'$ (5.2.9-12) - Examples. Reflection principles and transfinite induction (5.2.13-23)	339
§ 3	<u>Additional information from $() \rightarrow (\Sigma)'$: de Jongh's theorem</u> Statement of de Jongh's theorem (5.3.1-2) - - Preliminaries on the propositional calculus (5.3.3-8) - - Lemma on Jaskowski's trees (5.3.9) - The Gödel - Rosser - Mostowski - Kripke - Myhill theorem (5.3.10-12) - de Jongh's theorem for one propositional variable (5.3.16-19) - - Another theorem of de Jongh (5.3.20-22) - Further results on de Jongh's theorem (5.3.23)	348
§ 4	<u>Markov's schema</u> Markov's schema (5.4.1-3) - Independence of MP (5.4.4-6) - A comment on proof-theoretic closure properties (5.4.7-9) - The operation $() \rightarrow (\Sigma + \omega)'$ (5.4.10-14) - The class of models of <u>HA</u> +MP is preserved under $() \rightarrow (\Sigma + \omega)'$ (5.4.11) - <u>HA</u> +MP possesses ED, DP (5.4.12) - Closure properties of the class of sets Γ such that validity of <u>HA</u> + Γ is preserved by $() \rightarrow (\Sigma + \omega)'$ (5.4.13)	360
§ 5	<u>The schema IP_0^C</u> Proof-theoretic closure results (5.5.2-3) - Mutual independence of MP and IP_0^C (5.5.4-7) - Final comments on IP_0^C (5.5.8) - Uniform independence of IP_0^C , MP (5.5.9)	369
§ 6	<u>Definability of models of <u>HA</u>^C: applications</u> The operation $() \rightarrow (\Sigma)^*$ (5.6.1) - Definability (5.6.2-7) - The Hilbert - Bernays completeness theorem (5.6.8-9) - The Gödel - Rosser - Mostowski - Kripke - Myhill theorem revisited (5.6.10-12) - Σ_1^0 -substitution instances in de Jongh's theorem (5.6.13-16) -	372

- de Jongh's theorem for MP (5.6.20 - 22) - Other applications (to systems with $\text{RFN}(\mathcal{T})$, $\text{TI}(<)$) (5.6.23 - 26)

- § 7 Other systems 388
 Subsystems of Heyting's arithmetic (5.7.1 - 2) -
 - Extensions of HA : Theory of species (5.7.3) -
 - Other set-theoretic approaches (5.7.4).

VI. ITERATED INDUCTIVE DEFINITIONS, TREES AND ORDINALS (J.I. Zucker)

- § 1 Introduction 392
- § 2 The systems $\text{ID}_2(\mathcal{A})$ 397
 Inductively defined sets of numbers (6.2.1) - The class \mathcal{C} ; the theory $\text{ID}_2(\mathcal{A})$ for $\mathcal{A} \in \mathcal{C}$; definition of the ordinals $|\text{ID}_2|$, $|\text{ID}_2^c|$, $|\text{ID}_1|$, $|\text{ID}_1^c|$ (6.2.2)
- § 3 The theory T_2 401
 An intuitionistic theory of trees of the first 3 number or tree classes
- § 4 Computability of closed terms of T_2 404
 Definitions (6.4.1) - Uniqueness of normal form (6.4.3) -
 - Standard computability (6.4.4) - Proof of computability of closed terms (6.4.5 - 7), and hence of their normalizability (6.4.8) - Definition of the ordinal $|t|_{\mathcal{C}}$ (6.4.10)
- § 5 Strong computability 408
 Definitions (6.5.1) - All closed terms of T_2 are strongly computable (6.5.2 - 11), and hence strongly normalizable (6.5.12) - Hence all terms of T_2 (not necessarily closed) are normalizable (6.5.13)
- § 6 Models of T_2 ; modelling T_2 in $\text{ID}_2(\mathcal{O})$ 413
 Definitions (6.6.1 - 3) - Examples of well-founded models: \mathcal{M}_2 , HRO_2 , HEO_2 and CTNF_2 (6.6.4) - Extensionality: some general remarks (6.6.5) - Distinctions between well-founded models of T_1 and T_2 (6.6.6) - Definition of the ordinal $|\text{T}_2|$ (6.6.7) - Theorem: $|\text{T}_2| \leq |\text{ID}_2|$ (6.6.8)
- § 7 Functional interpretation of $\text{ID}_2(\mathcal{A})$ 421
 Introduction; definition of modified realizability (mr -)interpretation, the theories $\text{T}_2[\text{P}]$, $\underline{\text{E}} - \text{T}_2^{\text{F}}$ etc. (6.7.1) - Pairing functions (6.7.2) - Normal forms for translations of $\mathcal{A} \in \mathcal{C}$ (6.7.3) - Axioms for P_1 and P_2 (6.7.4) - "Soundness theorems" for interpretation (6.7.5 - 7) - Theorem: $|\text{ID}_2| \leq |\text{T}_2|$ (6.7.9) - Hence main result: $|\text{ID}_2| = |\text{T}_2|$ (6.7.10) - Note on extensionality axioms (6.7.11)
- § 8 Functional interpretations of classical systems $\text{ID}_1^c(\mathcal{O})$ and $\text{ID}_1^*(\mathcal{O})$ 435
 Introduction; definitions of $\text{ID}_v(\mathcal{O})$, $\text{ID}_v^c(\mathcal{O})$, $\text{ID}_v^*(\mathcal{O})$ ($v = 1, 2$) and the ordinal $|\text{T}_1|$ (6.8.1) - Functional interpretations (modified realizability and Dialectica) of $\text{ID}_1(\mathcal{O})$ and $\text{ID}_1^*(\mathcal{O})$ (6.8.2 - 3) -

- Proof that $|\mathbb{ID}_1^c| = |\mathbb{T}_1|$, using a majorizing technique (6.8.4-5) - Historical survey: other methods of characterizing $|\mathbb{ID}_1^c|$ (6.8.6) - Functional interpretations of $\mathbb{ID}_2(\mathcal{O})$ and $\mathbb{ID}_2^*(\mathcal{O})$; unknown whether $|\mathbb{ID}_2^c| = |\mathbb{T}_2|$ (6.8.7-11)

§ 9 Extensions to $\mathbb{ID}_v(A)$ and $\mathbb{ID}_v^c(A)$ for $v > 2$. 450

Equivalences with some subsystems of classical analysis

Generalization of result to $|\mathbb{ID}_v| = |\mathbb{T}_v|$ for certain $v > 2$; equivalence of various $\mathbb{ID}_v^c(A)$ with subsystems of classical analysis; unknown whether $|\mathbb{ID}_v^c| = |\mathbb{T}_v|$ for $v > 1$ (6.9.1) - Positive result: $|\mathbb{ID}_{<\omega}^c| = |\mathbb{ID}_{<\omega}|$ (6.9.2) - Theory \mathbb{W} - $\mathbb{ID}_{<\omega}^c(A)$ equivalent to classical analysis + Π_1^1 -CA (6.9.3)

APPENDIX: HEREDITARILY MAJORIZABLE FUNCTIONALS OF FINITE TYPE
(W.A. Howard)

§ 1	<u>Extensionality</u>	454
§ 2	<u>Hereditarily majorizable functionals</u>	455
§ 3	<u>Primitive recursive functionals</u>	457
§ 4	<u>Discussion of $\forall y E_2(y)$</u>	460
