

Contents

Introduction	11
1. Purpose and scope of this book	11
2. Acknowledgements	12
Chapter 1. The Cognitive and Morphodynamical Turns	15
1. Introduction	15
2. Morphodynamics in cognitive semiolinguistics	16
2.1. Characteristics of the cognitive turn	16
2.2. The path-breaking point of view of Morphodynamics	20
3. Three main examples of a cognitive approach to language	22
3.1. Ray Jackendoff	22
3.2. Ronald Langacker	25
3.3. Len Talmy	32
4. Previous cognitive perspectives	35
5. The problem of formalization and modeling	38
5.1. The limits of formalism	38
5.2. Computationalism: the symbolic/physical dualism	40
5.3. Mathematization vs. Formalization	43
5.4. Modeling and schematization	43
5.5. Morphodynamical models and connectionist models	44
6. Semantic realism and pheno-physics	45
6.1. Thom's squish and pure "etic" linguistics	45
6.2. The phenomenological question	48
6.3. Pheno-physics and ecological information	51
6.4. Realist phenomenology	53
7. Morphodynamics and complex systems	54
8. The problem of Universals	55
9. Morphological schemata and <i>proto-linguistics</i>	60
Chapter 2. Things	63
1. Introduction	63
2. The eidetic kernel of the concept of form	64
2.1. <i>Verschmelzung</i> and <i>Sonderung</i>	64

2.2.	The fit with some current ideas	65
2.3.	The origin of the <i>Verschmelzung</i> concept	66
2.4.	Qualitative discontinuities and segmentation	66
3.	Objective correlates of phenomenological descriptions	67
3.1.	Topological-geometrical explanation	67
3.2.	Morphodynamical explanation and pheno-physics	68
3.3.	Example: fields of oscillators	69
4.	A first cognitive explanation: Marr and wavelet analysis	70
5.	Global contour extraction	77
6.	Variational segmentation models in low-level vision	77
6.1.	Transforming the signal into a geometric observable	77
6.2.	The Mumford-Shah model	78
6.3.	The link with diffusion equations	81
7.	Scale-space analysis	82
7.1.	Multiscale differential geometry	82
7.2.	Scale-space morphogenesis of images	84
7.3.	Anisotropic diffusion and morphological analysis	87
7.4.	Generalizations	90
7.5.	A few mathematical remarks about contour diffusion	90
8.	Gestaltic applications	92
8.1.	Examples	92
8.2.	Crest, ridges and cut locus	93
9.	Skeletonization	93
9.1.	Harry Blum's contour diffusion and grassfire models	93
9.2.	Neural implementation of cut loci	94
9.3.	Properties and structure of cut loci	95
9.4.	Leyton's works	95
9.5.	The neurophysiological relevance of skeletonization	96
9.6.	Skeletonization and mereological constituency	96
9.7.	Multi-scale cut locus	98
10.	The binding problem and oscillator networks	99
10.1.	Cortical fibrations	100
10.2.	The binding problem and the labeling hypothesis	102
10.3.	Networks of oscillators	103
10.4.	Synchronized oscillations and segmentation	107
10.5.	Returning to the morphological nucleus	108
11.	Models for the Clark/Pylyshyn debate	109
11.1.	A. Clark: Feature-placing and proto-objects	109
11.2.	Z. Pylyshyn: Visual indexes and preconceptual objects	111
12.	From 2D to 3D	113
12.1.	Looking back on David Marr's perceptual theory	113
12.2.	Marr's $2^{1/2}$ D sketch and Husserl's adumbrations	114

Chapter 3. Relations	119
1. Introduction	119
1.1. The gestaltic conception of relations	119
1.2. Scope of this study	122
2. Talmy's Gestalt semantics	124
2.1. Active semantics	125
2.2. Basic structuring schemata	126
3. What is "cognitive topology"?	130
3.1. Convexification	131
3.2. Skeletonization	132
4. Operations on schemata: the 'across' puzzle	132
4.1. Invariant of transversality	132
4.2. Variants of transversality	133
4.3. Plasticity of perceptual-semantic schemata	134
4.4. Virtual structures	136
4.5. Other examples of virtual structures: fictive motion	138
5. Modeling principles and algorithms	139
5.1. Gestalt computation	139
5.2. Spreading activation	140
5.3. Links with other works	140
5.4. Morphological algorithms	141
6. Numerical simulations based on cellular automata	150
6.1. Example 1: "the ball in the box"	151
6.2. Example 2: "the bird in the cage"	155
6.3. Remarks	156
6.4. Example 3: "the lamp above the table"	157
6.5. Links with Kosslyn's works	159
6.6. Example 4: "zigzagging across the woods"	160
7. Wave dynamics in spiking neural networks	161
7.1. Dynamic pattern formation in excitable media	161
7.2. Spatio-temporal patterns in neural networks	162
7.3. Wave propagation and morphodynamical routines	163
7.4. Two wave categorization models	164
 Chapter 4. Processes: What is an "Attractor Syntax"?	 171
1. Introduction	171
2. Dynamical models of syntax	171
2.1. Weak CN vs. strong CN	172
2.2. Elementary vs. non-elementary CN syntax	172
3. Theoretical strategy: using the "morphological turn"	173
3.1. The concept of "structure" and Morphodynamics	173
3.2. Cognitive processing	174
3.3. The configurational definition of roles	174

3.4.	The link with spatial cognition	174
3.5.	The shift of mathematical level: “kernel sentences” . . .	174
4.	Connectionism and the theory of dynamical systems . . .	175
4.1.	The CNC main thesis and its precursors	175
4.2.	CN networks and dynamical systems	175
4.3.	Harmony theory	181
4.4.	The morphodynamical and PTC agendas	182
5.	Fodor and Pylyshyn’s arguments against connectionism . . .	183
5.1.	The general structure of the F-P arguments	183
5.2.	Comments: the problem of a dynamical structuralism . . .	188
5.3.	The main point of the F-P argument	191
5.4.	Towards a geometry of syntax	192
6.	Refutation of the F-P argument: the main problem	193
7.	Connectionist binding and configurational roles	196
7.1.	Smolensky’s tensorial product	196
7.2.	Dynamical binding	199
7.3.	The need for a configurational definition of roles	200
8.	The link with Chalmers’ criticism of F-P arguments	202
9.	The epistemology of the morphodynamical paradigm	203
Chapter 5. From Morphodynamics to Attractor Syntax		205
1.	Introduction	205
2.	Christopher Zeeman’s initial move	205
3.	The general morphodynamical model	209
3.1.	The internal dynamics and the internal states	209
3.2.	The criterion of selection of the actual state	211
3.3.	The external control space	211
3.4.	The field of dynamics	212
3.5.	Structural stability	212
3.6.	Categorization	213
3.7.	Retrieving the morphologies	213
3.8.	Fast/slow dynamics	214
3.9.	Lyapunov functions	214
3.10.	The reduction to gradient systems	215
3.11.	Contents and complex attractors	215
3.12.	Critical points, jets and Morse theory	215
3.13.	Normal forms and residual singularities	217
3.14.	The local ring of a singularity	218
3.15.	Universal unfoldings and classification theorems	220
4.	A few examples: cusp, swallowtail, butterfly	221
4.1.	The cusp	221
4.2.	The swallowtail	223
4.3.	The butterfly	226

5.	Applications of Morphodynamics	228
5.1.	Dynamical functionalism	228
5.2.	Actantial interactions and verbal nodes	231
5.3.	Actantial paradigms and their temporal syntagmation	233
5.4.	Actantial graphs and their combinatorics	234
5.5.	Summary of the principles	237
6.	Import and limits of Thom's paradigm	239
7.	Morphodynamics and Attractor Syntax	240
7.1.	The mathematization of Fillmore's scenes	240
7.2.	The localist hypothesis (LH)	242
7.3.	The uses of external dynamics	243
8.	Force dynamics from Talmy to Brandt	246
8.1.	The key idea	246
8.2.	Eve Sweetser's systematization	249
8.3.	Modal dynamics according to P. Aa. Brandt	249
Chapter 6.	Attractor Syntax and Perceptual Constituency	259
1.	"From pixels to predicates": the seven pillars of cognition	259
2.	Apparent motion and the perception of intentionality	259
3.	From actantial graphs to cognitive archetypes	261
3.1.	Cognitive archetypes	261
3.2.	Reformatting actantial graphs	263
4.	Contour diffusion and singular encoding of relations	264
4.1.	The general strategy for solving the main problem	264
4.2.	Contour diffusion, cobordism, and Morse theorem	265
4.3.	The example of the Association relation	266
4.4.	Generating potentials	267
4.5.	Processes and potential deformations	269
4.6.	Morse theory	269
4.7.	Representing positional information	272
5.	Contour propagation and the cut locus theory	273
Conclusion		275
Bibliography		279
