|                                                                                                                                |     |
|--------------------------------------------------------------------------------------------------------------------------------|-----|
| Preface . . . . .                                                                                                              | 1   |
| Lecture 1. Introduction . . . . .                                                                                              | 3   |
| Lecture 2. Solutions of the d'Alembert Equation<br>in $\mathbb{R}^n$ . . . . .                                                 | 14  |
| Lecture 3. Solutions of the d'Alembert Equation<br>in Arbitrary Domains . . . . .                                              | 39  |
| Lecture 4. Steady-State Scattering Theory in<br>Exterior Domains and the Limiting Absorption<br>Principle . . . . .            | 49  |
| Lecture 5. Time-Dependent Scattering Theory in<br>Exterior Domains . . . . .                                                   | 76  |
| Lecture 6. Steady-State Scattering Theory and<br>Eigenfunction Expansions for $A$ . . . . .                                    | 84  |
| Lecture 7. Wave Operators and Asymptotic Solutions<br>of the d'Alembert Equation in Exterior<br>Domains . . . . .              | 124 |
| Lecture 8. Asymptotic Wave Functions and Energy<br>Distributions in Exterior Domains . . . . .                                 | 142 |
| Appendix. An Existence Proof for the Wave<br>Operators Based on the Abstract Theory of<br>Scattering of M. S. Birman . . . . . | 167 |
| References . . . . .                                                                                                           | 180 |
