| Preface   |             |
| Introduction  | 1           |
| 1. Statistical description of systems in classical mechanics  | 3           |
| 2. Study of equilibrium distributions   | 14          |
| 2.1. The microcanonical distribution  | 14          |
| 2.2. The canonical distribution   | 21          |
| 2.3. The grand canonical distribution   | 28          |
| 3. The law of large numbers for macroscopic variables and the foundations of thermodynamics             | 39          |
| 3.1. General study of the probability laws of macrovariables  | 39          |
| 3.2. Derivation of the basic laws of thermodynamics   | 58          |
| 3.2.1. The rules for thermodynamic equilibrium  | 58          |
| 3.2.2. The rules for energy changes; work, heat and their relation to entropy                           | 67          |
| 3.2.3. The thermodynamical description of first order phase transitions                                 | 76          |
| 3.3. Some other uses of the concept of entropy  | 80          |
| 3.3.1. Information theory   | 80          |
| 3.3.2. Statistical models   | 84          |
| 3.4. Proof of the fundamental asymptotic properties of the structure measure in the thermodynamic limit | 87          |
| 3.4.1. Properties of the entropy $s(e,n)$   | 94          |
| 3.4.2. The existence of $s(e,n)$ when the interaction has infinite range                                | 105         |
| 3.4.3. A system in a slowly varying external field, the barometric formula                              | 112         |
| 3.5. The central limit theorem for macroscopic variables, thermodynamic fluctuation theory              | 115         |
| References  | 120         |
