

Contents

Introduction	7
Chapter 1: Padé-type approximants	9
1.1 Definition of the approximants	9
1.2 Basic properties	14
1.3 Convergence theorems	24
1.4 Some applications	28
1.5 Higher order approximants	32
Chapter 2: General orthogonal polynomials	40
2.1 Definition	40
2.2 Recurrence relation	43
2.3 Algebraic properties	50
2.3.1 Christoffel–Darboux relation	50
2.3.2 Reproducing kernels	51
2.3.3 Associated polynomials	53
2.4 Properties of the zeros	57
2.5 Interpolatory quadrature methods	61
2.6 Matrix formalism	67
2.6.1 Jacobi matrices	67
2.6.2 Matrix interpretation	69
2.7 Orthogonal polynomials and projection methods	75
2.7.1 The moment method	75
2.7.2 Lanczos method	79
2.7.3 Conjugate gradient method	84
2.8 Adjacent systems of orthogonal polynomials	91
2.9 Reciprocal orthogonal polynomials	105
2.10 Positive functionals	115
Chapter 3: Padé approximants and related matters	126
3.1 Padé approximants	126
3.1.1 Determinantal expression and matrix formalism	126
3.1.2 The cross rule	133
3.1.3 Recursive computation of Padé approximants	135
3.1.4 Normality	147
3.2 Continued fractions	152
3.3 The scalar ε -algorithm	159
3.3.1 The algorithm	159
3.3.2 Connection with orthogonal polynomials	171
3.3.3 Connection with the moment method	176
Chapter 4: Generalizations	178
4.1 The topological ε -algorithm	178

4.1.1	The algorithm	178
4.1.2	Solution of equations.	184
4.2	Double power series	190
4.2.1	Definition of the approximants	191
4.2.2	Basic properties	195
4.2.3	Higher order approximants	208
4.3	Series of functions	220
	Appendix	227
	Bibliography	240
	Index	249
