

CONTENTS

	<u>I. Introduction</u>	1
Lecture 1.	Type and cotype for a Banach space	1
	p-summing maps	1
Lecture 2.	Pietsch factorization theorem	5
Lecture 3.	Completely summing maps	9
	Hilbert-Schmidt and nuclear maps	9
Lecture 4.	p-integral maps	15
	<u>II. Cylindrical Probabilities and Radonifying Maps</u>	18
Lecture 5.	Completely summing maps: 6 equivalent properties	20
	p-Radonifying maps	20
Lecture 6.	Radonification Theorem	25
Lecture 7.	p-Gauss laws	29
Lecture 8.	proof of the Pietsch conjecture	32
Lecture 9.	p-Pietsch spaces	38
	Application: Brownian motion	38
Lecture 10	More on cylindrical measures and stochastic processes	42
	<u>III. Types and Cotypes</u>	46
Lecture 11.	Kahane inequality	47
	The case of L^p	47
	Z-type	47
Lecture 12.	Kahane contraction principle	51
	p-Gauss type	51
	The Gauss type interval is open	51

	<u>IV. Ultrapowers and Superproperties</u>	56
Lecture 12.	Finite representability of F in E	56
	Superproperties	57
	The "spectrum" of a Banach space	57
Lecture 13.	q -factorization, Maurey's theorem	58
	Grothendieck factorization theorem	58
Lecture 14.	Equivalent properties, summing vs. factorization	61
Lecture 15.	Non-existence of $(2+\epsilon)$ -Pietsch spaces	67
	Ultrapowers	67
Lecture 16.	The Pietsch interval	72
	The weakest non-trivial superproperty	72
	Cotypes, Rademacher vs. Gauss	72
Lecture 17.	Gauss-summing maps	78
	Grothendieck factorization theorem ($a=+\infty$)	81
	TLC and ILL	83
Lecture 18.	Super-reflexive spaces	85
	Modulus of convexity, q -convexity	85
	"Trees" and Kelly-Chatterji Theorem	85
	Enflo Theorem	85
	Modulus of smoothness, p -smoothness	85
	Properties equivalent to super-reflexivity	85
Lecture 19.	Martingale type and cotype	92
	Results of Pisier	92
	Twelve properties equivalent to super-reflexivity	92
	Type for subspaces of L^p (Rosenthal Theorem)	92
	A new result of Pisier	98
