

# Table of Contents

§1. The Siegel upperhalf plane and the symplectic group.	1
§2. Main problem and main results.	7
§3. The case of $g = 1$ .	11
§4. Boundary components and the structure of parabolic subgroups.	15
§5. Realization as a Siegel domain of the third kind, and Satake compactification.	29
§6. Theory of torus embeddings.	39
§7. Toroidal compactification due to Mumford.	58
A) Construction of toroidal compactification.	58
B) Geometric properties of toroidal compactifications (smoothness, projectivity, extension of holomorphic maps).	70
§8. Examples: reduction theory of positive quadratic forms.	85
§9. An application of the Voronoi compactification to the theory of moduli of polarized abelian varieties.	95
A) 2 <sup>nd</sup> Voronoi reduction theory.	95
B) Mixed decomposition of $\Omega^1 \times V$ .	100
C) Compactification of the moduli space of polarized abelian varieties.	102
D) The extension of Torelli map.	110
Appendix: Abstract theory of bounded symmetric domains (with explicit description in the case of Siegel upperhalf plane).	113
I. The structure of bounded symmetric domains.	113
A) Definition and realizations.	113
B) The structure of roots of $G$ .	119

C) The description of $\mathcal{D}$ in $\mathcal{A}_+$ via the Harish-Chandra embedding.	126
II. Boundary components.	128
A) Boundary components.	128
B) The normalizer of a boundary component.	134
C) The structure of $N(F)$ .	136
D) The natural projection $\pi_F : \mathcal{D} \rightarrow F$ .	140
E) Rational boundary components.	143
III. Realization of $\mathcal{D}$ as a Siegel domain of the third kind.	144
A) The self-adjoint cone $C(F)$ in $U(F)$ .	144
B) Realization of $\mathcal{D}$ as a Siegel domain.	145
C) Relation of the normalizers of adjacent boundary components.	152
Bibliography.	153
List of notations.	156
Index.	161
