

Contents

<i>Chapter 0. Preliminaries</i>	1
1. Definitions	2
2. First properties	4
3. Good and bad actions	9
4. Further properties	13
5. Résumé of some results of GROTHENDIECK	19
<i>Chapter 1. Fundamental theorems for the actions of reductive groups</i> .	24
1. Definitions	24
2. The affine case	27
3. Linearization of an invertible sheaf	30
4. The general case	36
5. Functional properties	44
<i>Chapter 2. Analysis of stability</i>	48
1. A numerical criterion	48
2. The flag complex	55
3. Applications	63
<i>Chapter 3. An elementary example</i>	67
1. Pre-stability	67
2. Stability	72
<i>Chapter 4. Further examples.</i>	74
1. Binary quantics	76
2. Hypersurfaces	79
3. Counter-examples	83
4. Sequences of linear subspaces	86
5. The projective adjoint action	88
6. Space curves	89
<i>Chapter 5. The problem of moduli — 1st construction</i>	96
1. General discussion	96
2. Moduli as an orbit space	98
3. First chern classes	104
4. Utilization of 4.6	109

<i>Chapter 6. Abelian schemes</i>	115
1. Duals	115
2. Polarizations	120
3. Deformations	124
 <i>Chapter 7. The method of covariants — 2nd construction</i>	127
1. The technique	127
2. Moduli as an orbit space	129
3. The covariant.	138
4. Application to curves	142
 <i>Appendix to Chapter 1</i>	145
 <i>Appendix to Chapter 2</i>	156
 <i>Appendix to Chapter 3</i>	159
 <i>Appendix to Chapter 4</i>	160
 <i>Appendix to Chapter 5</i>	171
 <i>Appendix to Chapter 7</i>	188
 <i>References</i>	206
 <i>Index of definitions</i>	221
