## Contents.

I. Introduction				
	I.1.	The maser principle	1	
	I.2.	The laser condition	2	
	I.3.	Properties of laser light	5	
		a) Spatial coherence	5	
		b) Temporal coherence	6 7	
		d) High intensity	7	
		e) Ultrashort pulses	7	
	I.4.	Plan of the article	7	
II.	II. Optical resonators			
		Introduction	9	
	II.2.	The Fabry-Perot resonator with plane parallel reflectors	11	
		a) Spatial distribution of modes	11	
		b) Diffraction losses	17 18	
	TT 2	Confocal resonator	19	
	11.5.	a) Field outside the resonator	20	
		b) Field inside the resonator	21	
		c) Far field pattern of the confocal resonator	21	
		d) Phase shifts and losses	21	
	II.4.	More general configurations	22	
		a) Confocal resonators with unequal square and rectangular apertures	22	
		b) Resonators with reflectors of unequal curvature	23	
		α) Large circular apertures	<b>2</b> 3	
		eta) Large square aperture	23	
	II.5.	Stability	23	
III.		n mechanical equations of the light field and the atoms without losses	24	
		Quantization of the light field	24	
		Second quantization of the electron wave field	27	
		Interaction between radiation field and electron wave field	28	
		The interaction representation and the rotating wave approximation	<b>2</b> 9	
		The equations of motion in the Heisenberg picture	30	
	III.6.	The formal equivalence of the system of atoms each having 2 levels		
		with a system of $\frac{1}{2}$ spins	31	
IV.		ion and fluctuation of quantum systems. The realistic laser equations .	33	
	IV.1.	Some remarks on homogeneous and inhomogeneous broadening	33	
		a) Natural linewidth	33	
		b) Inhomogeneous broadening	33 33	
		$\beta$ ) Gases	34	
		$\gamma$ ) Semiconductors	34	
		c) Homogeneous broadening	34	
		$\alpha$ ) Impurity atoms in solids $\beta$ ) Gases	34	
			34	

IV.2.	A survey of IV.2.—IV.11  a) Definition of heatbaths (reservoirs) b) The role of heatbaths c) Classical Langevin and Fokker-Planck equations  α) Langevin equations β) The Fokker-Planck equation d) Quantum mechanical formulation: the total Hamiltonian e) Quantum mechanical Langevin equations, Fokker-Planck equation and density matrix equation α) Langevin equations β) Density matrix equation β) Density matrix equation γ) Generalized Fokker-Planck equation	35 35 36 36 36 37 38 38 38 39
IV.3.	Quantum mechanical Langevin equations: origin of quantum mechanical Langevin forces (the effect of heatbaths)	39 40 42
IV.4.	The requirement of quantum mechanical consistency	44 44 45
IV.5.	The explicit form of the correlation functions of Langevin forces a) The field	46 46 46
IV.6.	The complete laser equations	50 50 50 51 51
IV.7.	<ul> <li>β) The matter equations</li> <li>The density matrix equation</li> <li>a) General derivation</li> <li>b) Specialization of Eq. (IV.7.31)</li> <li>α) Light mode</li> <li>β) Atom</li> <li>γ) The density matrix equation of the complete system of M laser</li> </ul>	51 51 51 56 56 57
IV.8.	modes and $N$ atoms	58 59
IV.9.	Generalized Fokker-Planck equation: definition of distribution functions	60 61 61 63
	functions	64 64 64 65 65
IV.10.	Equation for the laser distribution function (IV.9.22)	65 65 67 70
IV.11.	The calculation of multi-time correlation functions by means of the distribution function	71
_	es of quantized electromagnetic fields	73
	magnetic field	73

VII.10.	α) Equations for the photon densities       26         β) Equations for the frequency shifts       26         Some exactly solvable problems       20         a) Single-mode operation in solid state lasers       20         α) Homogeneously broadened line       20         1. Running waves       21         2. Standing waves in axial direction       22         3. Inhomogeneously broadened line, running waves       26         4. Single-mode in the gas laser       26         External fields       26         a) The effect of a longitudinal magnetic field on the single spatial mode output       26         b) The field equations       26         c) The matter equations       26         d) Solution of the amplitude and frequency-determining Eqs. (VII.9.24), (VII.9.25)       27         Ultrashort optical pulses: the principle of mode locking       27         a) Loss modulation by an externally driven modulator       27         b) Loss modulation by a saturable absorber       27         c) Gain modulation       27         d) Frequency modulation       28         d) Frequency modulation       29         Analogy to microwave circuits       20         Ultrashort optical pulses: detailed treatment of loss modulation       20	001 001 002 002 003 003 003 003 003 004 005 006 007 007 007 007 007 007 007 007 007

XIV Contents.

VII.12.	Super-radiance. Spin and photo echo	224
	a) Definition of super-radiant states	224
	b) Generation of super-radiant states	228
	$\alpha$ ) Classical treatment of the spin motion	228
	$\beta$ ) Quantum theoretical treatment	229
	c) Classical description of super-radiant emission	231
	d) The spin-echo experiment	231
	e) The photo-echo experiment	232
	f) A further analogy between a spin $\frac{1}{2}$ system and a two-level system:	
	the fictitious spin	
VII.13.	Pulse propagation in laser-active media	236
	a-c) Steady state and self-pulsing	
	$\alpha$ ) The basic equations	
	$\beta$ ) Stationary solution	238
	$\gamma$ ) Normalized amplitudes	238
	$\delta$ ) Stability of the stationary solution	238
	ε) Transient build-up of the pulse	
	ζ) Steady state pulse	
	$\eta$ ) A simplified model	
	$\vartheta$ ) The special case $v=c$	
	d) The $\pi$ -pulse	245
3711	e) The $2\pi$ -pulse. (Self-induced transparency)	
V11.14.	Derivation of rate equations	247
VIII. Rate equ	uations and their applications	249
	Formulation of rate equations and solution for the steady state	
	(especially: threshold condition, pump power requirement, single	
	versus multimode laser action)	240
	a) The rate equations	
	$\alpha$ ) The field equations	
	$\beta$ ) The matter equations	
	b) Treatment of the steady state	
	c) The completely homogeneous case	
	α) General formulation	
	$\beta$ ) 3-Level system, the lower transition is laser-active	252
	$\gamma$ ) Pump power at threshold	
	$\delta$ ) 3-Level system, the upper transition is laser-active	
	$\varepsilon$ ) 4-Level system, laser action between the two middle levels	255
VIII.2.	The coexistence of modes on account of spatial inhomogeneities or an	
	inhomogeneously broadened line	255
	a) Homogeneous line, but space-dependent modes (represented by	
	standing waves)	255
	a) Axial modes with a different frequency distance from the line	
	center	257
	$\beta$ ) Different losses	257
	b) Spatially inhomogeneous pumping, homogeneously broadened line	
	α) Running waves	
	$\beta$ ) Standing waves	
	c) Inhomogeneously broadened line	259
VIII.3.	Laser cascades	259
	a) Matter equations	260
	b) Homogeneously broadened line and standing waves (modes in	
	axial direction)	261
	c) Inhomogeneously broadened line and standing waves	261
	d) Discussion of an example	262
VIII.4.	Solution of the time-dependent rate equations. Relaxation	
	oscillations	264
	a) The 3-level system with laser action between the two lower levels	
	b) 3-Level system, laser action between the two upper levels	
	c) 4-Level system	
	d) Approximate solution for small oscillations	
VIII c	The giant pulse laser	
VIII.3.	a) Semiquantitative treatment	269
	b) Overtitative treatment	260
