Contents

PART A : INTRODUCTION

Chapter I - FUNDAMENTAL LAWS AND BASIC CONCEPTS

1. Balance equations for incompressible fluids 2
   A. Conservation of mass 2
   B. Conservation of momentum 8
   C. Conservation of energy 11
2. Fundamental thermodynamic relations ; entropy balance equation and second law 15
   A. Alternative forms of the energy balance equation 15
   B. The entropy balance equation and the second law of thermodynamics 25
3. Kinetic and constitutive equations 28
4. Systems of coordinates 37
   A. Rectangular coordinates 37
   B. Cylindrical coordinates 40
   C. Special two-dimentional case : the stream function 45
5. Equations for the fluctuations around a steady state 48
6. Definition of stability 53
7. Normal modes 57
8. Dimensionless numbers in fluid dynamics and heat transfer problems 61

Exercices 70

Bibliographical notes 76

Chapter II - MATHEMATICAL BACKGROUND AND COMPUTATIONAL TECHNIQUES

1. Use of variational principles and/or stationary properties of integrals 77
   A. Elements of variational calculus. The Euler-Lagrange equations 77
   B. Variational approach to the conservations laws based on nonequilibrium thermodynamics : the theory of the local potential 81
   C. The numerical methods associated with the local potential theory 94
   D. Relation between the local potential and the Galerkin techniques 98
2. Applications to stability problems 100
   A. The excess local potential 100
   B. Variational methods for linear eigenvalue problems 102
   C. Stability criterion based on Lyapounov function 113
3. Purely numerical techniques 120
   A. Finite differences methods 120
   B. Conversion of a boundary value problem into an initial value problem 134

Bibliographical notes 146

PART B : FLUIDS AT CONSTANT DENSITY, ISOTHERMAL FORCED CONVECTION

Chapter III - PLANAR FLOWS OF NEWTONIAN FLUIDS

1. Poiseuille and Couette flow 147
   A. Plane Poiseuille flow and Poiseuille flow in rectangular channels 147
   B. Plane Couette flow 152
2. General statements of linear hydrodynamic stability of forced convection 153
   A. The Orr-Sommerfeld equation 153
   B. Variational or stationary presentations of the Orr-Sommerfeld equation. Its relation with the Galerkin technique 161
   C. The Chock-Schechter integration scheme 171
   D. The Orr and the Prigogine-Glansdorff criterion 173
3. Numerical solutions of the Orr-Sommerfeld equation 179
   A. Selection of trial functions 179
   B. Solution for U = constant 184
   C. Solution for plane Poiseuille flow 185
      a. Effect of trial functions 185
      b. High Reynolds numbers 192
      c. Two and three dimensional perturbations without elimination of variables. Relation to Squire's theorem 192
      d. Finite difference methods 197
      e. Solution using the Chock-Schechter method 207
      f. General discussion, comparison with experiments 210
   D. Solution for Couette flow 213
4. Nonlinear stability of Poiseuille flow 221
   A. Introduction 221
   B. A restricted variational approach to the nonlinear equations 228
   C. Influence of the initial amplitude of the disturbance 233
5. An oscillatory solution in planar-Poiseuille flow 240
   A. Introduction 240
   B. Existence of statistically steady states 241
   C. Existence of periodic flows 242
   D. Stability and/or instability of the new periodic flow 244
6. Remarks on the transition to turbulence 248

Bibliographical notes 252

Chapter IV - CYLINDRICAL FLOWS OF NEWTONIAN FLUIDS

1. A. Poiseuille flow in a pipe 254
   B. Poiseuille flow down an annular pipe 256
2. General statements on linear stability of forced convection in cylindrical coordinates 257
   A. An equivalent of the Orr-Sommerfeld equation 257
   B. Non axisymmetric disturbances 260
3. Linear stability of pipe Poiseuille flow 263
   A. Stability with respect to two-dimensional axisymmetric disturbances 263
   B. Stability with respect to three-dimensional non axisymmetric disturbances 273

Bibliographical notes 290

Chapter V - FLOW STABILITY OF NON-NEWTONIAN FLUIDS

1. Stress-Strain relations for some particular non-newtonian fluids 291
   A. Introduction 291
   B. The Coleman-Noll model 292
2. Stability of plane Poiseuille flow for a second order viscoelastic fluid 294
   A. The generalized Orr-Sommerfeld equation 294
   B. The solution of the generalized Orr-Sommerfeld equation for plane flow 298
   C. Plane Poiseuille flow : sufficient condition for stability 301
   D. Instability of plane Poiseuille flow of a second order fluid : a numerical result 303
3. Stability of pipe Poiseuille flow for a second order fluid. 306

Bibliographical notes 314

PART C : NON ISOTHERMAL ONE COMPONENT SYSTEMS

Chapter VI - FREE CONVECTION IN ONE COMPONENT FLUID

1. Introduction 315
2. The linear theory of the Bénard problem 322
   A. The eigenvalue problem. Its solution for simple boundary conditions 322
   B. Solutions based on approximate numerical calculations 348

a. The local potential method 348
b. The Chock-Schechter numerical integration 356
C. Solution based on the thermodynamic stability criterion 359
D. Experimental aspect 367
E. Effect of lateral boundaries 380
F. Extension of the Bénard problem 406
a. Surface tension effect 407
b. Effect of a magnetic field 412
3. The non-linear theory of the Bénard problem 427
A. Approximate computational techniques 427
B. Global properties of the flow 437
a. Variation of the Nusselt number with the Rayleigh number (free boundary conditions) 437
b. Variation of the Nusselt number with the Rayleigh number (rigid boundary conditions) 440
c. Variation of the number of convective cells with the Rayleigh number 446
C. Fine structure of the flow 449
D. Behavior near threshold 458
E. Behavior far from the critical point 475
a. The Lorenz model 475
b. The routes to turbulence 484
4. The thermogravitational process 488
A. The steady state profile 488
B. The stability of the steady state profile 490

Bibliographical notes 497

Chapter VII - NON ISOTHERMAL FORCED CONVECTION IN A ONE-COMPONENT FLUID

1. General aspects of the effect of temperature gradients 500
2. Temperature gradients imposed by the boundary conditions 501
3. Temperature gradients due to viscous heating 507
A. Experimental interest 507
B. Cylindrical Poiseuille flow with viscous heating 509
a. the steady state 509
b. stability of cylindrical Poiseuille flow including viscous heating 518
4. Further discussion on the multiplicity of steady states when taking into account viscous heating 524

Bibliographical notes 528

Chapter VIII - MIXED CONVECTION IN A ONE-COMPONENT FLUID

1. Introduction in the Bénard problem with flow 529
2. Relation between two and three dimensional disturbances ; extension of Squire's theorem 534
3. Experiments on the onset of free convection with a superposed small laminar flow 545
4. Effect of lateral boundaries 556

Bibliographical notes 565

PART D : MULTICOMPONENT SYSTEMS

Chapter IX - FREE CONVECTION IN A MULTICOMPONENT FLUID

1. Introduction to the influence of concentration gradients on hydrodynamic stability 567
2. Formulation of the linearized problem 569
   A. The conservation equations 569
   B. The thermohaline problem 571
   C. The effect of thermal diffusion (or Soret effect) 574
3. The thermohaline convection : linear stability analysis 577
   A. The role of boundary conditions 577
   B. Free boundaries with specified solute concentrations and temperatures 581
   C. Experimental observations 585
4. Free convection with thermal diffusion : linear analysis 587
   A. Coupled equations for temperature and mass 587
   B. Exact solution of the simplified problem for free and pervious boundaries 587
   C. Variational solution for rigid boundaries 597
   D. Comparison with experimental results 615
   E. The role of the Dufour effect 630
5. Free convection with thermal diffusion : non linear effects 634
   A. Approximate computational techniques 634
   B. Results of the nonlinear analysis and comparison with experiments 636

Bibliographical notes 654

Chapter X - MIXED CONVECTION IN MULTICOMPONENT SYSTEMS

1. Mixed convection in multicomponent systems and measurements of the Soret coefficient 657
2. Results of linear hydrodynamic stability theory 667
A. Results for $\mathfrak{s} > 0$ 668
B. Results for $\mathfrak{s} < 0$ 670
3. Postface 672

Bibliographical notes 675
