

Contents

1	Introduction	1
1.1	Physics and Finance	1
1.2	Financial Markets	2
1.2.1	Basic Concepts	6
1.2.2	Financial Risk	8
1.3	Contributions of Physics to Economics	13
1.3.1	Geometric Brownian Motion	13
1.3.2	Probability Distributions	16
1.3.3	Random Matrix Theory	18
1.4	Motivation and Outline	21
2	Dynamics of Statistical Dependencies	25
2.1	Identifying States of a Financial Market	25
2.1.1	Similarity Measure	26
2.1.2	Empirical Study	27
2.1.3	Application to Portfolio Optimization	37
2.1.4	Summary	50
2.2	A Copula Approach	51
2.2.1	Copulae	52
2.2.2	Average Copula	53
2.2.3	Dynamics of the Copula	60
2.2.4	Summary	64
3	The Epps Effect	67
3.1	Asynchronous Time Series	69
3.1.1	Compensating Asynchronous Effects	70
3.2	Impact of the Tick-Size	76
3.2.1	Return Microstructure	77
3.2.2	Impact of the Tick-Size on Financial Correlations	83
3.2.3	Value-Discretized Time Series in General	84
3.2.4	Discretized Price Changes	88
3.2.5	Discretized Returns	90

3.3	Combined Compensation	92
3.4	Model Results	93
3.4.1	Asynchrony Compensation	95
3.4.2	Tick-Size Compensation	97
3.4.3	Combined Compensation	102
3.5	Empirical Results	103
3.5.1	Asynchrony Compensation	103
3.5.2	Tick-Size Compensation	106
3.5.3	Combined Compensation	108
3.6	Summary	110
4	Credit Risk	111
4.1	Phenomenology	112
4.2	Types of Credit Risk Models	114
4.3	A Structural Credit Risk Model	116
4.3.1	Definitions and Conventions	116
4.3.2	Price Distribution	119
4.3.3	Average Price Distribution	122
4.3.4	Loss Distribution	131
4.3.5	Average Loss Distribution	133
4.3.6	Homogeneous Portfolios	136
4.4	Application	139
4.5	Summary	142
5	Conclusions	145
A	Stock Ensembles	149
B	Derivations for Credit Risk	157
B.1	Expansion of $\det(\mathbf{I}N + T\mathbf{S}\vec{\omega}\vec{\omega}^\dagger\mathbf{S})$	157
B.2	Calculation of Ω_{K-1}	158
B.3	$M_{1,k}(z)$ and $M_{2,k}(z)$	158
	Bibliography	161
