Hans-Otto Georgii

Gibbs Measures and Phase Transitions

Walter de Gruyter
Berlin · New York 1988

Contents

Introduction 1

Part I. General theory and basic examples 9

Chapter 1 Specifications of random fields 11

1.1 Preliminaries 11
1.2 Prescribing conditional probabilities 15
1.3 λ-specifications 18

Chapter 2 Gibbsian specifications 25

2.1 Potentials 26
2.2 Quasilocality 30
2.3 Gibbs representation of pre-modifications 35
2.4 Equivalence of potentials 39

Chapter 3 Finite state Markov chains as Gibbs measures 44

3.1 Markov specifications on the integers 44
3.2 The one-dimensional Ising model 49
3.A Appendix. Positive matrices 54

Chapter 4 The existence problem 57

4.1 Local convergence of random fields 58
4.2 Existence of cluster points 60
4.3 Continuity results 66
4.4 Existence and topological properties of Gibbs measures 71
4.A Appendix. Standard Borel spaces 73

Chapter 5 Specifications with symmetries 81

5.1 Transformations of specifications 81
5.2 Gibbs measures with symmetries 85

Chapter 6 Three examples of symmetry breaking 94

6.1 Inhomogeneous Ising chains 95

6.2 The Ising ferromagnet in two dimensions 99
6.3 Shlosman's random staircases 106

Chapter 7 Extreme Gibbs measures 114

7.1 Tail triviality and approximation 115
7.2 Some applications 125
7.3 Extreme decomposition 129
7.4 Macroscopic equivalence of Gibbs simplices 136

Chapter 8 Uniqueness 140

8.1 Dobrushin's condition of weak dependence 140
8.2 Further consequences of Dobrushin's condition 153
8.3 Uniqueness in one dimension 164

Chapter 9 Absence of symmetry breaking. Non-existence 168

9.1 Discrete symmetries in one dimension 169
9.2 Continuous symmetries in two dimensions 178

Part II. Markov chains and Gauss fields as Gibbs measures 189

Chapter 10 Markov fields on the integers I 190

10.1 Two-sided and one-sided Markov property 191
10.2 Markov fields which are Markov chains 196
10.3 Uniqueness of the shift-invariant Markov field 204

Chapter 11 Markov fields on the integers II 209

11.1 Boundary laws, uniqueness, and non-existence 210
11.2 The Spitzer-Cox example of phase transition 221
11.3 Kalikow's example of phase transition 228
11.4 Spitzer's example of totally broken shift-invariance 233

Chapter 12 Markov fields on trees 238

12.1 Markov chains and boundary laws 238
12.2 The Ising model on Cayley trees 247

Chapter 13 Gaussian fields 256

13.1 Gauss fields as Gibbs measures 257
13.2 Gibbs measures for Gaussian specifications 267
13.3 The homogeneous case 273
13.A Appendix. Some tools of Gaussian analysis 284

Part III. Shift-invariant Gibbs measures 289

Chapter 14 Ergodicity 290

14.1 Ergodic random fields 290
14.2 Ergodic Gibbs measures 296
14.A Appendix. The multidimensional ergodic theorem 302

Chapter 15 A variational characterization of Gibbs measures 308

15.1 Relative entropy 309
15.2 Specific entropy 312
15.3 Specific energy and free energy 319
15.4 The variational principle 323

Chapter 16 Convex geometry and the phase diagram 328

16.1 The pressure and its tangent functionals 328
16.2 A geometric view of Gibbs measures 333
16.3 Phase transitions with prescribed order parameters 338
16.4 Ubiquity of pure phases 349

Part IV. Phase transitions in reflection positive models 355

Chapter 17 Reflection positivity 357

17.1 The chessboard estimate 357
17.2 Gibbs distributions with periodic boundary condition 364

Chapter 18 Low energy oceans and discrete symmetry breaking 372

18.1 Percolation of spin patterns 373
18.2 Discrete symmetry breaking at low temperatures 384
18.3 Examples 388

Chapter 19 Phase transitions without symmetry breaking 398

19.1 Potentials with degenerated ground states, and perturbations thereof 398
19.2 Exploiting Sperner's lemma 405
19.3 Models with an entropy–energy conflict 410
19.A Appendix. Sperner's lemma 421

Chapter 20 Continuous symmetry breaking in N-vector models 423

20.1 Some preliminaries 424
20.2 Spin wave analysis, and spontaneous magnetization 429
