

ETG CONGRESS 2015 – Die Energiewende

After the term “Energiewende” has made its way into the English language, it is time to establish a dedicated forum to discuss related topics in detail. The Power Engineering Society (ETG) of the German Association for Electrical, Electronic & Information Technologies (VDE) has decided to hold its biannual ETG Congress for the coming years under the headline “Die Energiewende”, starting with the congress in 2015.

Poster sessions as well as four tracks with invited papers dealing with System Aspects, Technologies & Components, Markets & Regulatory Environment as well as Reference Projects will provide a broad basis for all experts to present and to discuss the challenges of and solutions for the new energy age.

The new format of the International ETG Congress 2015 aims to intensify the dialogue between manufacturers and academia. Manufacturers and solution providers have the opportunity of presenting their products prior to the congress as well as within specified timeframes during the congress. These selling activities as well as manufacturers’ forums can be tailored individually. On a first come first serve principle different presentation rooms and booths are offered. Moreover, the International ETG Congress 2015 offers the possibility to participate in different sponsorships. For instance, the premium sponsor will have the chance to hold a thematically focussed keynote during one of the four plenary sessions.

All experts, from users through manufacturers to academia, are kindly invited to contribute to the congress by presenting their posters. Although the congress is organized by the Power Engineering Society, cross-domain energy solutions addressing topics such as power to gas or power to heat are highly welcomed. Last but not least, the congress will be the perfect forum for students and young professionals to get in contact with all kinds of experts dealing with the latest technologies and solutions for the sake of a bright future of energy.
