

Inhaltsverzeichnis

1	Grundschwingungen des Universums	1
1.1	Einleitung	1
1.2	Sokratisches Gespräch	1
1.2.1	Unser Foto eines Quasars	1
1.2.2	Wie schnell ist der Urknall?	3
1.2.3	Sehen wir Quanten?	5
1.2.4	Wie viel Energie hat ein Lichtquant?	9
1.2.5	Wie klein geht es?	9
1.2.6	Wie kombiniert man Regionen der Größe L_P ?	11
1.2.7	Wie wird die Energie minimal?	13
1.2.8	Welche Grundschwingung entsteht?	14
1.2.9	Dichte der Grundschwingung in $D=3$	16
1.2.10	Was haben wir nun erreicht?	19
2	Cosmic Unification	21
2.1	Introduction	21
2.2	Observations	23
2.2.1	Critical density	23
2.2.2	Density parameters	25
2.2.3	Observation that provides Ω_r	26
2.3	Purpose of this investigation	27
2.3.1	Age of the universe and time line	28
2.3.2	Numerical input	29
2.3.3	Parameters to be derived	29
2.4	Usual homogeneous and isotropic model	30
2.4.1	Solution of the FLE	31
2.4.1.1	Integration by parts	31
2.4.1.2	Evolution of densities	32
2.4.1.3	Integral with normalized scale radius	32
2.4.2	Calculation of the age of the universe	33
2.4.3	Calculation of the light horizon	35
2.4.3.1	Derivation	35

	2.4.3.2	Integration	37
2.5		Observable states	38
	2.5.1	Observable structure: definition of IWOSIS	38
	2.5.2	Smallest IWOSIS	38
	2.5.2.1	Combination of two limitations	38
	2.5.2.2	Observation with smallest uncertainty	38
	2.5.2.3	Elaboration of the smallest IWOSIS	40
	2.5.3	Smallest ball WOSIS	42
	2.5.4	Ball WOSIS due to uncertainty	44
2.6		Newtonian gravity at higher dimension	45
	2.6.1	Gaussian gravity	45
	2.6.2	Gravitational energy:	46
	2.6.3	Schwarzschild radius in dimension D :	46
	2.6.4	Elementary regions	48
	2.6.5	Interactions of elementary regions	49
	2.6.6	Interactions in the early universe	49
	2.6.7	Interaction of two ERs	49
2.7		A model of the universe	50
	2.7.1	Basics of the microscopic part of the model	52
	2.7.1.1	Isotropy	52
	2.7.1.2	Homogeneity	52
	2.7.1.3	Modeled ERs	53
	2.7.1.4	Fixed density	53
	2.7.1.5	General relativity dynamics	53
	2.7.2	Quantum dynamics of the microscopic part	54
	2.7.2.1	Adiabatic separation of the dynamics	56
	2.7.2.2	Geometric observation of curvature	57
	2.7.2.3	Mathematically equivalent dynamics	58
	2.7.2.4	Equivalent physical systems	60
	2.7.2.5	Physical equivalence of the two dynamics	60
	2.7.2.6	Dynamics at higher dimension	60
	2.7.2.7	Momentum	61
	2.7.2.8	Quantization	61
	2.7.2.9	Ground state	62
2.8		Solution at high density and small distance	63
	2.8.1	Probability density	63
	2.8.2	Expectation value of potential energy	63
	2.8.3	Convention of potential energy	63
	2.8.3.1	Basic idea	63
	2.8.3.2	Implementation of the basic idea	64
	2.8.4	Enclosed mass	65
	2.8.5	Force generated by enclosed M or E	66

2.8.6	Derivation of expectation value of E_{pot}	66
2.8.7	Limit of high density and short distance	67
2.8.8	Wave function	68
2.8.9	Fixed point procedure	68
2.9	Approximate solution	69
2.9.1	Approximations	69
2.9.1.1	Variational method	69
2.9.1.2	Two cases	69
2.9.1.3	Quantum fluctuations	70
2.9.1.4	Linear approximation	70
2.9.2	Development of the adiabatic separation	71
2.9.2.1	Expectation values	71
2.9.2.2	Quantum fluctuations	71
2.9.2.3	Implementation of adiabatic separation	71
2.10	Solution for $b \gg a_M$	72
2.10.1	Implementation of natural units	72
2.10.2	Approximation of expectation value	73
2.10.3	Classical term	74
2.10.4	Quantum term	74
2.10.5	Variation of the fluctuations	74
2.10.6	Dimensional transition	76
2.10.6.1	Procedure	76
2.10.6.2	Critical densities	77
2.10.6.3	Enlargement factor	77
2.10.6.4	Maximal dimension	79
2.10.6.5	Dimensional horizon	80
2.10.6.6	Calculation of the dimensional horizon	80
2.10.7	Dimensional transitions explain inflation	84
2.11	Vacuum part of the model	85
2.11.1	Gravitational waves and ρ_v	86
2.11.1.1	Candidate for the vacuum density	86
2.11.1.2	Basic properties of gravitational waves	87
2.11.1.3	Quantization of gravitational waves	87
2.11.1.4	Zero-point oscillations	88
2.11.2	Densities at D_{max}	88
2.11.2.1	Structure of the density $\tilde{\rho}_{D,r}$ of radiation	89
2.11.2.2	Meaning of the time evolution of the actual light horizon	89
2.11.2.3	Origin of the density $\tilde{\rho}_{D,r}$ of radiation	90
2.11.2.4	Origin of the density $\tilde{\rho}_{D,v}$ of the vacuum	90
2.11.3	Time evolution of the densities	93
2.11.3.1	Vacuum density during the expansion of space	93

2.11.3.2	ZPO during the expansion of space	93
2.11.3.3	Formed volume during the expansion of space	94
2.11.3.4	Invariant number of ZPOs at a dimensional transition	94
2.11.3.5	Redshift of ZPO and ZPE at a dimensional transition	94
2.11.3.6	Modes of ZPO and ZPE at a dimensional transition	95
2.11.3.7	Time t_f of the formation of three dimen- sional space	95
2.11.3.8	ZPE $\tilde{E}_v$ or $\tilde{M}_v$ at t_f	95
2.11.3.9	Density $\tilde{\rho}_v$ at t_f	96
2.11.3.10	Explicit dependence on D_{max}	96
2.11.3.11	Minimum dimension three	97
2.11.3.12	Density $\tilde{\rho}_{v,t_f}$ and ZPE for $D_{max} = 301$. . .	97
2.12	Study of the polychromatic vacuum	98
2.12.1	Procedure	99
2.12.1.1	Procedure at a time t_{form}	99
2.12.1.2	Averaging	99
2.12.1.3	Change ΔV of the volume	99
2.12.2	Dimensional horizon at t_{form}	101
2.12.2.1	Light horizons	101
2.12.2.2	Dimensional enlargement factor	101
2.12.2.3	Actual light horizon	102
2.12.2.4	Dimensional enlargement factor $Z_{D_{max}(t_0) \rightarrow D=3}$	103
2.12.2.5	Light horizon at t_{form}	103
2.12.2.6	Evolved light horizon	103
2.12.2.7	Time evolution of the dimensional horizon .	104
2.13	Calculation of the density parameter Ω_Λ	105
2.13.1	Theoretical input	105
2.13.1.1	Fixed point iteration for density parameter Ω_v	105
2.13.1.2	Time iteration	106
2.13.1.3	Critical densities	106
2.13.2	Numerical input	107
2.13.2.1	Input for actual time and matter as reference	107
2.13.2.2	Input for general time and matter	107
2.13.3	Iteration	108
2.13.3.1	Method of comparison with observation . .	108
2.13.3.2	Λ - CDM model	108
2.13.3.3	Density parameters based on observation . .	109
2.13.3.4	Discrepancy of different measurements of H_0	109

2.13.3.5	Density parameters based on the present theory	109
2.13.3.6	Results for each type of evaluation of CMB data	110
2.13.3.7	Discussion of the results	110
2.13.3.8	Iteration corresponding to TT,TE,EE + low E + lensing	112
2.13.4	Solution of discrepancy of Hubble constants	114
2.13.4.1	Correction term for H_0	114
2.13.4.2	Comparison with observations of H_0	119
2.13.4.3	Discussion of modeled values for H_0	120
2.14	Formation of dark matter	122
2.14.1	Local minima as elementary particles?	122
2.14.1.1	Exclusion of local minima at $D = 3$	123
2.14.1.2	Exclusion of local minima at $D = 4, D = 5$ and $D = 6$	123
2.14.1.3	Local minimum at $D = 8$	123
2.14.2	Properties of the local minimum at $D = 8$	124
2.14.2.1	Interaction	124
2.14.2.2	Density and $E_{D=8,loc,opt}$	124
2.14.2.3	Mass and radius of the optimal $\tilde{b}_{8,opt}$ -ball	125
2.14.2.4	Elementary particle	125
2.14.2.5	Dimers	126
2.15	Dynamics of dark matter formation	127
2.15.1	Basic idea	127
2.15.2	Derivation	128
2.15.2.1	Fermi's golden rule	129
2.15.2.2	Form of wave functions	129
2.15.2.3	Initial wave function	131
2.15.2.4	Final wave function	131
2.15.2.5	Overlap of wave functions	132
2.15.2.6	Hamilton operator $\hat{H}_1$ of the perturbation	133
2.15.2.7	Factorization	134
2.15.2.8	Density of states $n(E_f)$ per unit energy	136
2.15.2.9	Distance of interaction	139
2.15.2.10	Kinetics	140
2.15.2.11	Transforming fraction of energy	143
2.15.3	Algorithmic implementation	144
2.15.4	Results	145
2.15.5	Observation of dark matter	146
2.15.5.1	Time of comparison	146

2.15.5.2	Observed actual density parameter of dark matter	147
2.15.5.3	Observed density parameter of dark matter at t_{eq}	147
2.15.5.4	Time evolution until t_{eq}	147
2.15.6	Comparison with observation	150
2.16	Λ - CDM values based on G , c and h	151
2.16.1	Λ - CDM model	151
2.16.2	Parameters of the Λ - CDM model	152
2.16.3	Density parameters and interaction	152
2.16.4	Calculation of Ω_j from universal constants	153
2.16.5	Extension of two algorithms	153
2.16.6	Intersection points	154
2.16.7	Extension of the algorithm for the dark energy	155
2.16.8	Extension of the algorithm for the dark matter	155
2.16.8.1	Fixed point	155
2.16.8.2	Derivation of Ω_Λ as a function of $Q_c(t_{eq})$	156
2.16.8.3	Algorithm for the determination of the fixed point	156
2.16.9	Performance of the algorithm for dark energy	157
2.16.10	Performance of the algorithm for dark matter	157
2.16.11	Calculation of intersection point	157
2.16.11.1	Density parameters	158
2.16.12	Interpretation	158
2.17	Extended FLE	159
2.17.1	Dynamics $\langle \dot{a} \rangle$ of the expectation value $\langle a \rangle$	159
2.17.2	Derivation of the EFLE	160
2.18	q-classical limit	161
2.18.1	Method	161
2.18.2	Interpretation	161
2.18.3	q-classical limit of the vacuum density	162
2.18.4	q-classical limit of $\frac{\Delta b}{b}$	164
2.18.5	q-classical limit of $\frac{E_{D,Q}}{E_{D,cl,G}}$	165
2.18.6	q-classical limit of E_D	166
2.18.6.1	Determination of $E_{D,cl,G}$	166
2.18.7	FLE in natural units	167
2.18.8	q-classical limit of the EFLE	168
2.18.8.1	q-classical limit without elementary particles	168
2.18.8.2	q-classical limit with elementary particles	169
2.18.9	q-classical limit of dark matter	169
2.19	Time evolution of space	170

2.19.1	Slowing of the dynamics of the EFLE	170
2.19.1.1	Analysis of the EFLE	171
2.19.1.2	Solution for $a_M \gg b$	172
2.19.1.3	Dynamics for $a_M \gg b$	172
2.19.1.4	Dynamics for $a_M \ll b$	173
2.19.2	Density $\tilde{\rho}_{D,ins}$ of instability	174
2.19.2.1	Zero of $\Delta E_{D,loc}$ as a function of $\Delta \tilde{\rho}_D$	174
2.19.3	Special densities	174
2.19.4	Implementation of the time evolution of space	176
2.19.5	Results for the time evolution of space	179
2.20	Solved problems	179
2.20.1	Solution of the big bang singularity problem	180
2.20.2	Solution of the flatness problem	180
2.20.2.1	Density parameter	180
2.20.2.2	Time evolution of Ω_K	181
2.20.2.3	Flatness problem	181
2.20.2.4	Solution of the problem of flatness	182
2.20.2.5	Expectation value of the density parameter	182
2.20.2.6	Energy conservation at the SOCLS	183
2.20.2.7	Energy and $\langle k \rangle$ at $t_{D_{max}}$	183
2.20.2.8	Density parameter $\langle \Omega_K \rangle$ at t_0	184
2.20.3	Solution of the horizon problem	185
2.20.3.1	Distance propagated by radiation	185
2.20.4	Solution of the reheating problem	186
2.20.5	Solution of the fine-tuning problem	187
2.20.6	Solution of the dark energy problem	187
2.20.7	Solution of the Hubble constant problem	188
2.20.8	Solution of the dark matter problem	188
2.21	Limit D to infinity	188
2.22	Comparison with observations	189
2.23	Predictions	190
2.24	Discussion	191
2.24.1	Applied principles	192
2.24.2	Robustness and applied approximations	194
2.24.3	Tests	194
2.24.4	Dimensional transitions	195
2.24.5	Aim of the investigation	195
2.25	Research program	195
2.26	Frequently asked questions	196
2.27	Methods	209
2.27.1	Uncertainty relation at higher dimension	209
2.27.2	Calculation of scale factors	209

2.27.3 Natural units	210
2.27.4 Notation	211
