Ángel López-García

The Grammar of Genes

How the Genetic Code Resembles
the Linguistic Code

Peter Lang

2 <i>Inside out: the evolution of the brain</i>	15
2.1 The battle over linguistic evolution: the Darwinian paradigm	15
2.2 Baldwinian evolution and exaptation	18
2.3 The big mutation hypothesis	21
2.4 In search of another explanation	24
3 <i>Outside in: the evolution of language</i>	27
3.1 Learning a language	27
3.2 Two outside in models: motor control and gesture	28
3.3 The evolution of language culture	30
3.4 An old fashioned comparison: language as an organism	31
3.5 A new comparative approach: language as a species	34
3.6 The formal properties of linguistic evolution	35
3.6.1 The structure of evolution	35
3.6.2 Methodology: samples for the study of evolution	36
3.6.3 The causes of evolution	36
3.7 Linguistic speciation	38
3.7.1 Mechanisms of speciation	38
3.7.2 Patterns and rythms of speciation	39
3.8 Language is culture but grammatical units are not cultural ones	39
4 <i>Formal inheritance</i>	43
4.1 Do formal patterns precede their manifestation?	43
4.2 The inheritance of form in the natural world	46
4.3 The genes of language?	48
4.4 On pregnancy and salience: the concept of 'figurative effect'	49

4.5	Linguistic pregnancies: the emergence of syntactic laws	51
4.6	Epigenesis as a source for emergent properties	56
4.7	Protolanguage as a product of perceptual networks	58
5	<i>How complex syntax can be?</i>	63
5.1	On linguistic form	63
5.2	Types of grammar: generative, cognitive, and functional grammars	65
5.3	The formal syntax	68
5.4	A glance at the syntactic principles	69
5.4.1	Dependence relations characterize the summing up of lexical items	69
5.4.2	Dependence relations are established among heterogeneous units	70
5.4.3	Agreement: some overt relationships help to solve adjustment problems	71
5.4.4	Anaphora and ellipsis as cohesive procedures	72
5.4.5	Categories	74
5.4.6	Movement relates different orderings of the chain of words	74
5.4.7	Restrictions of movement	76
5.4.8	The construction of texts in speech acts forms	76
5.5	On the significance of the formal properties of syntax	77
6	<i>A blind alley</i>	81
6.1	A striking parallelism	81
6.2	Some inadequacies of the comparison	84
6.3	What does the genetic code really look like and how does it work?	89
7	<i>On the code: the form of genetic code maps the form of linguistic code</i>	95
7.1	Method: looking for a formal correspondence	95
7.2	Phrase structure and Codon structure	97
7.2.1	The third base and the Complement	97
7.2.2	The second base and the Head	98
7.2.3	The first base and the Specifier	99
7.2.4	Summary: a codon is formally similar to a Phrase . . .	99
7.3	Nucleotides and categories	101

8	<i>Further formal parallelisms between genetic code and linguistic code</i>	105
8.1	A provisiuonal summary of formal resemblances	105
8.2	Satellite DNA as a formal pattern for constituent structure . . .	106
8.3	Genetic crossing-over resembles syntactic movement	109
8.4	Crossover fixation as a formal model of recursion	110
8.5	Wobble as a formal schema for agreement	111
8.6	Empty categories follow the formal model of transposons	115
8.7	Subjacency is framed like cis-dominance	118
9	<i>Linguistic texts and genomic strings share some formal devices</i>	121
9.1	On genetic levels and linguistic levels	121
9.2	Sentences as transcriptional units	124
9.2.1	The promoter and the talk openings	125
9.2.2	Control at termination and the talk closings	127
9.3	The utterance markers and the translation markers	129
9.4	The regulation of texts and the operon	131
9.5	Positive and negative control	135
9.5.1	Positive control	136
9.5.2	Negative control	137
10	<i>The organizer</i>	141
10.1	The inheritance of formal codes	141
10.2	The limits of emergence	144
10.3	The concept of pre-program	147
10.4	The organizer	149
10.5	Homeobox once again	152
10.6	Genetic code meets linguistic code	153
11	<i>The limits of complexity</i>	157
11.1	A double source for complexity	157
11.2	The origin of language: a gradual process with a break	160
11.3	Syntax as a symbiosis of several genetic encodages	164
12	<i>Some concluding remarks</i>	169
