

Inhaltsverzeichnis

1	Entstehung dunkler Energie	1
1.1	Einleitung	1
1.1.1	Entdeckung der beschleunigten Ausdehnung	1
1.1.2	Dunkle Energie	3
1.1.3	Lösungsmethode	4
1.1.4	Quantengravitation	6
1.1.5	Quantengravitation im weiteren Sinne	8
1.1.6	Quantengravitation im engeren Sinne	9
1.1.7	Objekte der Quantengravitation	12
1.1.8	Erkenntnisgewinnung durch Enträtseln von Geheimnissen der Natur	15
1.2	„Kosmische Inflation“ durch Entfaltung	16
1.2.1	Gravitationsinstabilitäten	17
1.2.2	Instabilitäten der Quantengravitation	18
1.2.3	Sehr hohe Dichte: unser Modell	20
1.2.4	Schritte der Entwicklung des Modells	21
1.2.4.1	Schritt 1: Beobachtbare Situationen	21
1.2.4.2	Schritt 2: Reguläre Probemasse	22
1.2.4.3	Schritt 3: Dynamische Dimension	22
1.2.4.4	Schritt 4: Trennung von Raum und Zeit	23
1.2.4.5	Schritt 5: Dichte als Zustand bestimmende Variable	23
1.2.4.6	Schritt 6: Strukturbildung	23
1.2.4.7	Schritt 7: Strahlungsära	24
1.2.4.8	Schritt 8: Quantengravitation	25
1.2.4.9	Schritt 9: Grundzustand und Potential	26
1.2.4.10	Schritt 10: Übergangswahrscheinlichkeiten	26
1.2.4.11	Schritt 11: Feldquantisierung	27
1.2.4.12	Schritt 12: Entstehung von Materie	27
1.2.5	Zur Lösung des Modells	27
1.2.6	Potential abhängig von der Dimension	28
1.2.6.1	Optimierung durch Variation	29

1.2.6.2	Partitionierung der a - Kugeln	30
1.2.7	Gravitationsinstabilität der Raumdimension	32
1.2.8	Schlagartige Abstandsvergrößerung	33
1.2.9	Wie weit war der Raum zusammengefaltet?	36
1.2.10	Erklärung der „kosmischen Inflation“	38
1.3	Berechnung der „kosmischen Inflation“	38
1.3.1	Besondere Dichten	38
1.3.2	Entwicklung des Radius	41
1.4	Erklärung der dunklen Energie	44
1.4.1	Folgerungen aus dem Streckfaktor $k(t)$	44
1.4.2	Schwingungsmoden der dunklen Energie	45
1.4.3	Dichte am Dimensionshorizont	46
1.4.4	Dunkle Energie am Dimensionshorizont	48
1.4.5	Dunkle Energie am Ende der Ära der CU	48
1.4.6	Berechnung zum heute emergierenden Vakuum	49
1.4.7	Berechnung der Dichte des vorhandenen Vakuums	50
1.4.8	Enträtseln widersprüchlicher Hubble - Konstanten	52
1.4.9	Zusammenfassende Erklärung	52
1.5	Vergleich mit Beobachtungen	54
1.6	Zusammenfassung	54
2	Emergence of dark energy	57
2.1	Introduction	57
2.2	Problems	61
2.2.1	Development of theory by solving problems	61
2.2.2	Problem of dark energy or vacuum energy	62
2.2.3	Problem of source of dark energy	62
2.2.4	Problem of divergence at zero - point oscillations	62
2.2.5	Problem of 'different Hubble constants'	62
2.2.6	Problem of the luminiferous aether and dynamics of space	63
2.3	Theory	64
2.3.1	Basic theory for gravity and space: GRT	64
2.3.1.1	Cosmological principle	64
2.3.1.2	Starting point model	65
2.3.2	Basic quantum theory for microcosm	66
2.3.3	Elementary quantum gravity: Planck scale	66
2.3.4	Our model	68
2.3.4.1	Modeling step 1: observable states	68
2.3.4.2	Modeling step 2: regular probing mass	69
2.3.4.3	Modeling step 3: dynamical dimension	69
2.3.4.4	Modeling step 4: separation of space and time	70

2.3.4.5	Modeling step 5: state variable density . . .	70
2.3.4.6	Modeling step 6: structure formation	72
2.3.4.7	Modeling step 7: radiation era	72
2.3.4.8	Modeling step 9: ground state and potential	73
2.3.4.9	Modeling step 8: quantum gravity	74
2.3.4.10	Adiabatic separation	75
2.3.4.11	Modeling step 10: transition probabilities .	75
2.3.4.12	Modeling step 11: quantization of the field .	75
2.3.4.13	Modeling step 12: formation of matter . . .	76
2.4	Explanation of 'cosmic inflation' or CU	76
2.4.1	Static and dynamic equations	76
2.4.2	Dimensional transitions	78
2.4.3	Evolution of light horizon	79
2.5	Explanation of dark matter	82
2.5.1	Static stability of dark matter	82
2.5.2	Dynamics of formation of dark matter	84
2.5.3	Crystallization of dark matter	85
2.6	Empirical findings about the vacuum	89
2.6.1	Discovery of the density of the vacuum	89
2.6.2	Observed densities	92
2.7	Particular vacuum modes emerge	97
2.7.1	Two particular classes of densities	97
2.7.2	Modes of the vacuum	99
2.7.3	Zero rest-mass	99
2.7.4	Emergence of the vacuum	101
2.7.5	Zero - point oscillations	102
2.8	Vacuum density during 'cosmic inflation'	103
2.8.1	Primordial state	104
2.8.2	Dimensional horizon of an observer	106
2.8.3	Primordial density of the vacuum	107
2.8.4	Evolution of the wavelengths of the vacuum	108
2.8.5	Complete evolution of the wavelengths	109
2.8.6	Density at the dimensional horizon	109
2.9	Vacuum density after 'cosmic inflation'	111
2.9.1	Density corresponding to wavelengths	111
2.9.2	Propagation of the modes of the vacuum	112
2.10	Calculation of scale factors	114
2.10.1	Calculation of the density of radiation	117
2.10.2	Calculation of light horizons	117
2.10.3	Calculation of horizons at the end of CU	119
2.11	Calculation of dimensional horizons	120
2.11.1	Iteration	120

2.11.2	Enlargement of space	121
2.11.2.1	Scale factor	122
2.11.2.2	Factorization	123
2.11.2.3	Geometric character of the primordial state	125
2.11.2.4	Geometric character of completely folded state	125
2.12	Calculation of the vacuum density	127
2.12.1	Vacuum modes at the dimensional horizon	127
2.12.1.1	Modes of polarization	128
2.12.1.2	Spatial modes at the ground state	128
2.12.1.3	Energy of the modes at the ground state . .	128
2.12.1.4	Energy per polarization at the ground state	129
2.12.2	Modes of the vacuum at three dimensions	130
2.12.2.1	Modes at a dimensional transition	130
2.12.2.2	Vacuum density at an enlargement Z	131
2.12.2.3	Density of vacuum at time t	133
2.12.2.4	Time average of the vacuum density	134
2.13	Comparison with observations	135
2.13.1	Comparison with the observed density	135
2.13.2	Comparison with the local Hubble constant	136
2.14	Explanations	139
2.14.1	How does the space expand?	139
2.14.2	Where does that wave function come from?	139
2.14.3	Where does the vacuum density come from?	140
2.14.4	What establishes density of the vacuum?	140
2.14.5	How does the density of the vacuum evolve?	140
2.14.6	At what vacuum does an observer live?	141
2.15	Solved problems	142
2.15.1	Problem of dark energy or vacuum energy	142
2.15.2	Problem of source of dark energy	142
2.15.3	Problem of divergence at zero - point oscillations . .	142
2.15.4	Problem of 'different Hubble constants'	143
2.15.5	Problem of the luminiferous aether and dynamics of space	144
2.16	Open questions	145
2.16.1	Might the big rip change to stability?	145
2.16.2	Optimum of elementary particle and crystal	145
2.16.3	Dark matter spectroscopy	146
2.16.4	Predictions	147
2.17	Summary	147
2.18	Tables and Glossary	149
