

Table of Contents

I: PRELIMINARIES	1
1.1. What is “computational synthetic geometry” ?	1
1.2. Invariant theory and the Grassmann-Plücker relations	7
1.3. Matroids and oriented matroids	11
II: ON THE EXISTENCE OF ALGORITHMS	18
2.1. Encoding affine algebraic varieties in matroids	18
2.2. On the algorithmic Steinitz problem	23
2.3. Real realizability versus rational realizability	28
III: COMBINATORIAL AND ALGEBRAIC METHODS	32
3.1. A basis-free coordinatization algorithm for a class of matroids	32
3.2. Applications to n_3 -configurations and other examples	37
3.3. Inequality reduction and coordinatization of oriented matroids	50
IV: ALGEBRAIC CRITERIA FOR GEOMETRIC REALIZABILITY	61
4.1. Preliminaries from algebraic and semi-algebraic geometry	61
4.2. Final polynomials for matroids	68
4.3. Oriented matroids, the Steinitz problem and symmetric realizations	76
4.4. On the Grassmann stratification and a problem of N.White	80
V: GEOMETRIC METHODS	87
5.1. Geometric construction and topology of a class of oriented matroids	87
5.2. On neighborly polytopes with few vertices	92
5.3. A small counterexample to a conjecture of G.Ringel	96
5.4. An integral geometry approach to oriented matroids	99
VI: RECENT TOPOLOGICAL RESULTS	102
6.1. Oriented matroids without the isotopy property	103
6.2. Simplicial polytopes without the isotopy property	106
6.3. Mnëv’s universality theorem	112
VII: PREPROCESSING METHODS	115
7.1 Generation of oriented matroids with specific properties	115
7.2. On the solvability sequence method	119
7.3 On the finding of final polynomials by linear programming	121
7.4. Final polynomials with symmetries	125
VIII: ON THE FINDING OF POLYHEDRAL MANIFOLDS	133
8.1. Historical remarks	133
8.2. Combinatorial theories for generating manifolds	135
8.3. Manifolds with minimal number of vertices	137
IX: MATROIDS AND CHIROTOPES AS ALGEBRAIC VARIETIES ...	147
9.1. New algebraic methods for oriented matroids	148
9.2. Syzygies for chirotope polynomials	150
9.3. Applications for planar problems	155
References	158
Index	167
