Logical dependence of the chapters	IX
Notations	X
Introduction	1
 <i>Part One: What are G-functions?</i>	11
Chapter I: G-functions	12
1. Heights and sizes	12
2. Radii	18
3. Several variables; diagonalization	20
4. Examples	24
5. Counterexamples	32
Appendix: calculus of factorials	36
Chapter II: Geometric differential equations	38
1. Definition	38
2. Generalization: modules with connection arising from algebraic geometry	40
3. Solutions of geometric differential equations; algebraic structure	43
 <i>Part Two: G-functions and differential equations</i>	45
Chapter III: Fuchsian differential systems: formal theory	46
1. Logarithmic singularities	46
2. The language of ∂ -modules	48
3. Special changes of basis	51
4. Blow-up	53
5. Formal Frobenius and Christol functors	55
Appendix: a zero estimate	58
Chapter IV: Fuchsian differential systems: arithmetic theory	61
1. Background of p-adic analysis	61
2. p-adic differential systems	64
3. Global radius of a ∂ -module over $K(x)$	69
4. Size of a ∂ -module	71
5. G-operators ($\rho(\Lambda)$ and $\sigma(\Lambda)$)	74
Appendix: outline of a theorem of Dwork-Robba	85

Chapter V: Local methods	87
1. Resolution of apparent singularities	87
2. Analytic Frobenius functor	89
3. Inversion of the Frobenius functor	92
4. Convergence of the uniform part	98
5. From $\rho(\Lambda)$ to $\rho(Y)$	101
6. From $\rho(Y)$ to $\sigma(Y)$	103
Appendix: the geometric situation	110
Chapter VI: Global methods	112
1. Iterating Λ	112
2. Non-vanishing of a crucial determinant	114
3. Hermite-Padé approximants	119
4. From $\sigma(y)$ to $\sigma(\Lambda)$	120
5. Main theorem	124
<i>Part Three: Diophantine questions</i>	127
Chapter VII: Independence of values of G-functions	128
1. Introduction	128
2. Approximating forms	130
3. A method of Gel'fond	131
4. Local dependence	134
5. Global dependence; Hasse's principle	139
6. Application to diophantine equations	140
Appendix: on Runge's method	145
Chapter VIII: A criterium of rationality	147
1. Statement of the results	147
2. Approximating forms	155
3. A method of Gel'fond	156
4. Application: the isogeny theorem, after Chudnovsky	158
<i>Part Four: G-functions in arithmetic algebraic geometry</i>	162
Chapter IX: Towards Grothendieck's conjecture on periods of algebraic manifolds	163
1. Periods	163
2. Hodge cycles and period relations	168
3. Period relations: the relative case	173
4. Periods and G-functions	184
5. Conclusion	193
Appendix: special Mumford-Tate groups and absolute Hodge cycles	196

Chapter X: Endomorphisms in the fibers of an Abelian pencil	200
1. Introduction: distribution of the exceptional fibers	200
2. Period relations on exceptional fibers	203
3. Constructing non-trivial global relations	209
4. Special points on Shimura varieties and other comments	214
Appendix: a new proof of the transcendence of π	217
 Bibliography	220
Index	225
Glossary of notations	228
