

Contents

Chapt. 1	INTRODUCTION	1
Chapt. 2	BASIC EQUATIONS	5
2.1	General	5
2.2	Diffusion	5
2.2.1	Diffusion current	8
2.3	Convection	8
2.4	Migration	9
2.5	Total transport equation	11
2.6	Homogeneous kinetics	11
2.7	Heterogeneous kinetics	12
2.8	The Nernst diffusion layer and dimensionless variables	14
2.9	Adsorption kinetics	19
Chapt. 3	DIFFUSIONAL TRANSPORT - DIGITALLY	23
3.0	Introduction	23
3.1	Finite-difference expressions of derivatives	23
3.1.1	The box method	24
3.1.2	Discretisation by common sense	27
3.1.3	Taylor expansion developments	29
3.1.4	The point method	31
3.1.5	The point method with a $\frac{1}{2}h$ grid shift	33
3.2	Spherical and cylindrical systems	34
3.2.1	Box method	34
3.2.2	Point method	37
3.3	The factor λ	38
3.3.1	A simulation "by hand" with λ too large	38
3.3.2	What happens to errors?	40
3.4	How far out into the solution do we go?	40
3.5	A simple example program	42
Chapt. 4	CALCULATION OF BOUNDARY VALUES	45
4.1	The simple current approximation	45
4.2	Boundary values for controlled current	46
4.2.1	Electrode potential for a reversible system	47
4.2.2	Electrode potential for a quasireversible system	48
4.3	Boundary values for controlled potential	49
4.3.1	Reversible systems	49
4.3.2	Quasireversible systems	51
4.4	Inert walls	51
4.5	Multistep reactions	52
4.5.1	All-reversible multi-step reaction	55
4.5.2	All-quasireversible multi-step reaction	57
4.5.3	Constant current applied to multi-step reactions	58
4.6	Adsorption kinetics	59
4.6.1	Adsorption controlled by transport	59
4.6.2	Adsorption-rate controlled adsorption	61
4.7	Better current (g-) approximation	63
4.7.1	N-point derivations	63
4.8	General n-point boundary value expressions	68
4.8.1	Controlled current	68
4.8.2	Controlled potential	69
4.8.3	Multistep reactions	70
4.8.4	Adsorption kinetics	71
4.9	Final remark	71

Chapt. 5	ADVANCED METHODS	73
5.1	Runge-Kutta Integration (RKI)	74
5.2	Crank-Nicolson (CN) scheme	81
5.2.1	Solving the Crank-Nicolson system	84
5.2.2	Implicit c_i	86
5.3	Unequal intervals	90
5.3.1	Implementing unequal intervals: explicit methods	95
5.3.2	Implementing unequal intervals: Crank-Nicolson	96
5.3.3	The current approximation with unequal intervals	99
5.4	Orthogonal Collocation (OC)	100
5.4.1	Introduction	100
5.4.2	The flux calculation	107
5.4.3	Complex reactions	107
5.4.4	Implicit boundary values?	108
5.4.5	Homogeneous chemical reactions	108
5.4.6	The quantity " β "	109
5.4.7	Comments	109
5.5	Hopscotch	110
5.6	Miscellaneous techniques	112
Chapt. 6	ACCURACY, EFFICIENCY AND CHOICE	115
6.1	Definitions	115
6.2	What should be accurate?	117
6.3	Errors	117
6.3.1	Discretisation errors	117
6.3.2	Round-off errors	119
6.3.3	The current approximation	120
6.3.4	Error cancelling	120
6.3.5	Fudge factors and arbitrary parameters	122
6.4	Efficiency comparisons	126
6.4.1	The 4/3 factor with the box method	127
6.4.2	The Cottrell experiment	128
6.4.3	Chronopotentiometry	129
6.4.4	A simple EC system (Reinert and Berg, 1962)	130
6.4.5	Linear sweep voltammetry (LSV)	132
6.4.6	Remark on convergences	134
6.4.7	Conclusions; recommendations	134
Chapt. 7	COUPLED HOMOGENEOUS CHEMICAL REACTIONS	137
7.1	Introduction	137
7.2	Classification systems	138
7.3	Symbols and normalisation	138
7.4	The problems	140
7.5	Slow chemical reactions	142
7.5.1	A real-life example	145
7.6	Medium-speed chemical reactions	149
7.6.1	The real-life example again	152
7.7	Fast chemical reactions	154
7.8	Final remark	157

Chapt. 8	MISCELLANEOUS TOPICS	159
8.1	Convection	159
8.1.1	The dropping mercury electrode (dme)	160
8.1.2	The rotating disk electrode (rde)	163
8.2	Two-dimensional systems	166
8.2.1	Simple explicit method	167
8.2.2	Unequal intervals	168
8.2.3	Implicit techniques: ADI	169
8.2.4	Hopscotch	172
8.2.5	Other methods	173
8.2.6	The current calculation	173
8.3	Steady state systems	174
8.4	Ac voltammetry	176
8.5	Other discretisation schemes	177
Chapt. 9	PROGRAMMING AND EXAMPLE PROGRAMS	179
9.1	Language and style	179
9.2	Error checking	180
9.3	Library routines	182
9.4	Example programs	188
