Introduction *xxv*

1	Mathematical and Control Theory Background	1
1.1	Introduction	1
1.2	Models for Dynamical Systems	1
1.2.1	Dynamical Systems in Continuous Time	1
1.2.2	Dynamical Systems in Discrete Time	2
1.2.3	Linear Models and Linearization	3
1.2.3.1	Linearization at a Given Point	3
1.2.3.2	Linearizing Around a Trajectory	6
1.2.4	Converting Between Continuous- and Discrete-Time Models	6
1.2.4.1	Time Delay in the Manipulated Variables	7
1.2.4.2	Time Delay in the Measurements	9
1.2.5	Laplace Transform	9
1.2.6	The z Transform	10
1.2.7	Similarity Transformations	11
1.2.8	Minimal Representation	11
1.2.9	Scaling	14
1.3	Analyzing Linear Dynamical Systems	15
1.3.1	Transfer Functions of Composite Systems	15
1.3.1.1	Series Interconnection	15
1.3.1.2	Parallel Systems	16
1.3.1.3	Feedback Connection	16
1.3.1.4	Commonly Used Closed-Loop Transfer Functions	17
1.3.1.5	The Push-Through Rule	17
1.4	Poles and Zeros of Transfer Functions	18
1.4.1	Poles of Multivariable Systems	19
1.4.2	Pole Directions	19
1.4.3	Zeros of Multivariable Systems	20
1.4.4	Zero Directions	22

1.5	Stability	23
1.5.1	Poles and Zeros of Discrete-Time Transfer Functions	23
1.5.2	Frequency Analysis	24
1.5.2.1	Steady-State Phase Adjustment	26
1.5.3	Bode Diagrams	27
1.5.3.1	Bode Diagram Asymptotes	27
1.5.3.2	Minimum Phase Systems	29
1.5.3.3	Frequency Analysis for Discrete-Time Systems	30
1.5.4	Assessing Closed-Loop Stability Using the Open-Loop Frequency Response	31
1.5.4.1	The Principle of the Argument and the Nyquist D-Contour	31
1.5.4.2	The Multivariable Nyquist Theorem	32
1.5.4.3	The Monovariable Nyquist Theorem	32
1.5.4.4	The Bode Stability Criterion	32
1.5.4.5	Some Remarks on Stability Analysis Using the Frequency Response	35
1.5.4.6	The Small Gain Theorem	36
1.5.5	Controllability	37
1.5.6	Observability	38
1.5.7	Some Comments on Controllability and Observability	39
1.5.8	Stabilizability	40
1.5.9	Detectability	40
1.5.10	Hidden Modes	41
1.5.11	Internal Stability	41
1.5.12	Coprime Factorizations	43
1.5.12.1	Inner–Outer Factorization	44
1.5.12.2	Normalized Coprime Factorization	44
1.5.13	Parametrization of All Stabilizing Controllers	44
1.5.13.1	Stable Plants	45
1.5.13.2	Unstable Plants	45
1.5.14	Hankel Norm and Hankel Singular Values	46
	Problems	47
	References	49
2	Control Configuration and Controller Tuning	51
2.1	Common Control Loop Structures for the Regulatory Control Layer	51
2.1.1	Simple Feedback Loop	51
2.1.2	Feedforward Control	51
2.1.3	Ratio Control	54
2.1.4	Cascade Control	54
2.1.5	Auctioneering Control	55
2.1.6	Split Range Control	56
2.1.7	Input Resetting Control	57
2.1.8	Selective Control	59
2.1.9	Combining Basic Single-Loop Control Structures	60
2.1.10	Decoupling	61

2.2	Input and Output Selection	62
2.2.1	Using Physical Insights	63
2.2.2	Gramian-Based Input and Output Selection	64
2.2.3	Input/Output Selection for Stabilization	65
2.3	Control Configuration	66
2.3.1	The Relative Gain Array	66
2.3.2	The RGA as a General Analysis Tool	68
2.3.2.1	The RGA and Zeros in the Right Half-Plane	68
2.3.2.2	The RGA and the Optimally Scaled Condition Number	68
2.3.2.3	The RGA and Individual Element Uncertainty	69
2.3.2.4	RGA and Diagonal Input Uncertainty	69
2.3.2.5	The RGA as an Interaction Measure	70
2.3.3	The RGA and Stability	70
2.3.3.1	The RGA and Pairing of Controlled and Manipulated Variables	71
2.3.4	Summary of RGA-Based Input–Output Pairing	72
2.3.5	Partial Relative Gains	72
2.3.6	The Niederlinski Index	73
2.3.7	The Rijnsdorp Interaction Measure	73
2.3.8	Gramian-Based Input–Output Pairing	74
2.3.8.1	The Participation Matrix	75
2.3.8.2	The Hankel Interaction Index Array	75
2.3.8.3	Accounting for the Closed-Loop Bandwidth	76
2.4	Tuning of Decentralized Controllers	76
2.4.1	Introduction	76
2.4.2	Loop Shaping Basics	77
2.4.3	Tuning of Single-Loop Controllers	79
2.4.3.1	PID Controller Realizations and Common Modifications	79
2.4.3.2	Controller Tuning Using Frequency Analysis	81
2.4.3.3	Ziegler–Nichols Closed-Loop Tuning Method	86
2.4.3.4	Simple Fitting of a Step Response Model	86
2.4.3.5	Ziegler–Nichols Open-Loop Tuning	88
2.4.3.6	IMC-PID Tuning	88
2.4.3.7	Simple IMC Tuning	89
2.4.3.8	The Setpoint Overshoot Method	91
2.4.3.9	Autotuning	95
2.4.3.10	When Should Derivative Action Be Used?	95
2.4.3.11	Effects of Internal Controller Scaling	96
2.4.3.12	Reverse Acting Controllers	97
2.4.4	Gain Scheduling	97
2.4.5	Surge Attenuating Controllers	98
2.4.6	Multiloop Controller Tuning	99
2.4.6.1	Independent Design	100
2.4.6.2	Sequential Design	102
2.4.6.3	Simultaneous Design	103
2.4.7	Tools for Multivariable Loop-Shaping	103

2.4.7.1	The Performance Relative Gain Array	103
2.4.7.2	The Closed-Loop Disturbance Gain	104
2.4.7.3	Illustrating the Use of CLDG's for Controller Tuning	104
2.4.7.4	Unachievable Loop Gain Requirements	107
	Problems	108
	References	112
3	Control Structure Selection and Plantwide Control	115
3.1	General Approach and Problem Decomposition	115
3.1.1	Top-Down Analysis	115
3.1.1.1	Defining and Exploring Optimal Operation	115
3.1.1.2	Determining Where to Set the Throughput	116
3.1.2	Bottom-Up Design	116
3.2	Regulatory Control	117
3.2.1	Example: Regulatory Control of Liquid Level in a Deaeration Tower	118
3.3	Determining Degrees of Freedom	121
3.4	Selection of Controlled Variables	122
3.4.1	Problem Formulation	123
3.4.2	Selecting Controlled Variables by Direct Evaluation of Loss	124
3.4.3	Controlled Variable Selection Based on Local Analysis	125
3.4.3.1	The Minimum Singular Value Rule	127
3.4.3.2	Desirable Characteristics of the Controlled Variables	128
3.4.4	An Exact Local Method for Controlled Variable Selection	128
3.4.5	Measurement Combinations as Controlled Variables	130
3.4.5.1	The Nullspace Method for Selecting Controlled Variables	130
3.4.5.2	Extending the Nullspace Method to Account for Implementation Error	130
3.4.6	The Validity of the Local Analysis for Controlled Variable Selection	131
3.5	Selection of Manipulated Variables	132
3.5.1	Verifying that the Proposed Manipulated Variables Make Acceptable Control Possible	133
3.5.2	Reviewing the Characteristics of the Proposed Manipulated Variables	134
3.6	Selection of Measurements	135
3.7	Mass Balance Control and Throughput Manipulation	136
3.7.1	Consistency of Inventory Control	138
	Problems	140
	References	141
4	Limitations on Achievable Performance	143
4.1	Performance Measures	143
4.1.1	Time-Domain Performance Measures	143
4.1.2	Frequency-Domain Performance Measures	145
4.1.2.1	Bandwidth Frequency	145
4.1.2.2	Peaks of Closed-Loop Transfer Functions	146

4.1.2.3	Bounds on Weighted System Norms	146
4.1.2.4	Gain and Phase Margin	147
4.2	Algebraic Limitations	148
4.2.1	$S + T = I$	148
4.2.2	Interpolation Constraints	148
4.2.2.1	Monovariable Systems	148
4.2.2.2	Multivariable Systems	149
4.3	Control Performance in Different Frequency Ranges	149
4.3.1	Sensitivity Integrals and Right Half-Plane Zeros	149
4.3.1.1	Multivariable Systems	150
4.3.2	Sensitivity Integrals and Right Half-Plane Poles	150
4.3.3	Combined Effects of RHP Poles and Zeros	150
4.3.4	Implications of the Sensitivity Integral Results	150
4.4	Bounds on Closed-Loop Transfer Functions	151
4.4.1	The Maximum Modulus Principle	152
4.4.1.1	The Maximum Modulus Principle	152
4.4.2	Minimum Phase and Stable Versions of the Plant	152
4.4.3	Bounds on S and T	153
4.4.3.1	Monovariable Systems	153
4.4.3.2	Multivariable Systems	153
4.4.4	Bounds on KS and KSG_d	154
4.5	ISE Optimal Control	156
4.6	Bandwidth and Crossover Frequency Limitations	156
4.6.1	Bounds from ISE Optimal Control	156
4.6.2	Bandwidth Bounds from Weighted Sensitivity Minimization	157
4.6.3	Bound from Negative Phase	158
4.7	Bounds on the Step Response	158
4.8	Bounds for Disturbance Rejection	160
4.8.1	Inputs for Perfect Control	161
4.8.2	Inputs for Acceptable Control	161
4.8.3	Disturbances and RHP Zeros	161
4.8.4	Disturbances and Stabilization	162
4.9	Limitations from Plant Uncertainty	164
4.9.1	Describing Uncertainty	165
4.9.2	Feedforward Control and the Effects of Uncertainty	166
4.9.3	Feedback and the Effects of Uncertainty	167
4.9.4	Bandwidth Limitations from Uncertainty	168
	Problems	168
	References	170
5	Model-Based Predictive Control	173
5.1	Introduction	173
5.2	Formulation of a QP Problem for MPC	175
5.2.1	Future States as Optimization Variables	179
5.2.2	Using the Model Equation to Substitute for the Plant States	180

5.2.3	Optimizing Deviations from Linear State Feedback	181
5.2.4	Constraints Beyond the End of the Prediction Horizon	182
5.2.5	Finding the Terminal Constraint Set	183
5.2.6	Feasible Region and Prediction Horizon	184
5.3	Step-Response Models	185
5.4	Updating the Process Model	186
5.4.1	Bias Update	186
5.4.2	Kalman Filter and Extended Kalman Filters	187
5.4.2.1	Augmenting a Disturbance Description	188
5.4.2.2	The Extended Kalman Filter	189
5.4.2.3	The Iterated Extended Kalman Filter	189
5.4.3	Unscented Kalman Filter	190
5.4.4	Receding Horizon Estimation	193
5.4.4.1	The Arrival Cost	195
5.4.4.2	The Filtering Formulation of RHE	196
5.4.4.3	The Smoothing Formulation of RHE	196
5.4.5	Concluding Comments on State Estimation	198
5.5	Disturbance Handling and Offset-Free Control	199
5.5.1	Feedforward from Measured Disturbances	199
5.5.2	Requirements for Offset-Free Control	199
5.5.3	Disturbance Estimation and Offset-Free Control	200
5.5.4	Augmenting the Model with Integrators at the Plant Input	203
5.5.5	Augmenting the Model with Integrators at the Plant Output	205
5.5.6	MPC and Integrator Resetting	208
5.6	Feasibility and Constraint Handling	210
5.7	Closed-Loop Stability with MPC Controllers	212
5.8	Target Calculation	213
5.9	Speeding up MPC Calculations	217
5.9.1	Warm-Starting the Optimization	218
5.9.2	Input Blocking	219
5.9.3	Enlarging the Terminal Region	220
5.10	Robustness of MPC Controllers	222
5.11	Using Rigorous Process Models in MPC	225
5.12	Misconceptions, Clarifications, and Challenges	226
5.12.1	Misconceptions	226
5.12.1.1	MPC Is Not Good for Performance	226
5.12.1.2	MPC Requires Very Accurate Models	227
5.12.1.3	MPC Cannot Prioritize Input Usage or Constraint Violations	227
5.12.2	Challenges	227
5.12.2.1	Obtaining a Plant Model	228
5.12.2.2	Maintenance	228
5.12.2.3	Capturing the Desired Behavior in the MPC Design	228
	Problems	228
	References	231

6	Some Practical Issues in Controller Implementation	233
6.1	Discrete-Time Implementation	233
6.1.1	Aliasing	233
6.1.2	Sampling Interval	233
6.1.3	Execution Order	235
6.2	Pure Integrators in Parallel	235
6.3	Anti-Windup	236
6.3.1	Simple PI Control Anti-Windup	237
6.3.2	Velocity Form of PI Controllers	237
6.3.3	Anti-Windup in Cascaded Control Systems	238
6.3.4	A General Anti-Windup Formulation	239
6.3.5	Hanus' Self-Conditioned Form	240
6.3.6	Anti-Windup in Observer-Based Controllers	241
6.3.7	Decoupling and Input Constraints	243
6.3.8	Anti-Windup for "Normally Closed" Controllers	244
6.4	Bumpless Transfer	245
6.4.1	Switching Between Manual and Automatic Operation	245
6.4.2	Changing Controller Parameters	246
	Problems	246
