I	Symmetry transformations	1
A	Basic symmetries	1
B	Symmetries in classical mechanics	5
C	Symmetries in quantum mechanics	26
A_I	Eulerian and Lagrangian points of view in classical mechanics	31
1	Eulerian point of view	32
2	Lagrangian point of view	34
B_I	Noether's theorem for a classical field	38
1	Lagrangian density and Lagrange equations for continuous variables	38
2	Symmetry transformations and current conservation	40
3	Generalization, relativistic notation	41
4	Local conservation of energy	42

II	Some ideas about group theory	45
A	General properties of groups	46
B	Linear representations of a group	56
A_{II}	Left coset of a subgroup; quotient group	65
1	Left cosets	65
2	Quotient group	66

III	Introduction to continuous groups and Lie groups	69
A	General properties	70
B	Examples	85
C	Galilean and Poincaré groups	98

A_{III}	Adjoint representation, Killing form, Casimir operator	109
1	Adjoint representation of a Lie algebra	109
2	Killing form ; scalaire product and change of basis in $\mathcal{L}$	111
3	Completely antisymmetric structure constants	113
4	Casimir operator	114
IV	Induced representations in the state space	117
A	Conditions imposed on the transformations in the state space . . .	119
B	Wigner's theorem	121
C	Transformations of observables	126
D	Linear representations in the state space	128
E	Phase factors and projective representations	133
A_{IV}	Unitary projective representations, with finite dimension, of connected Lie groups. Bargmann's theorem	141
1	Case where $\mathcal{G}$ is simply connected	142
2	Case where $\mathcal{G}$ is p -connected	145
B_{IV}	Uhlhorn-Wigner theorem	149
1	Real space	149
2	Complex space	153

V	Representations of Galilean and Poincaré groups: mass, spin, and energy	157
A	Representations in the state space	158
B	Galilean group	159
C	Poincaré group	173
A_V	Proper Lorentz group and $SL(2C)$ group	191
1	Link to the $SL(2, C)$ group	191
2	Little group associated with a four-vector	198
3	W^2 operator	202
B_V	Commutation relations of spin components, Pauli–Lubanski four-vector	205
1	Operator S	205
2	Pauli–Lubanski pseudovector	207
3	Energy-momentum eigensubspace with any eigenvalues.	210
C_V	Group of geometric displacements	213
1	Brief review: classical properties of displacements	214
2	Associated operators in the state space	223

D_V	Space reflection (parity)	233
1	Action in real space	233
2	Associated operator in the state space	235
3	Parity conservation	237

VI	Construction of state spaces and wave equations	241
A	Galilean group, the Schrödinger equation	242
B	Poincaré group, Klein–Gordon, Dirac, and Weyl equations	254
A_{VI}	Relativistic invariance of Dirac equation and non-relativistic limit	273
1	Relativistic invariance	273
2	Non-relativistic limit of the Dirac equation	276
B_{VI}	Finite Poincaré transformations and Dirac state space	281
1	Displacement group	281
2	Lorentz transformations	283
3	State space and Dirac operators	287
C_{VI}	Lagrangians and conservation laws for wave equations	293
1	Complex fields	293
2	Schrödinger equation	295
3	Klein–Gordon equation	297
4	Dirac equation	300

VII	Rotation group, angular momenta, spinors	303
A	General properties of rotation operators	304
B	Spin 1/2 particule; spinors	323
C	Addition of angular momenta	329
A_{VII}	Rotation of a spin 1/2 and SU(2) matrices	339
1	Modification of a spin 1/2 polarization induced by an SU(2) matrix	340
2	The transformation is a rotation	341
3	Homomorphism	342
4	Link with the chapter VII discussion	344
5	Link with double-valued representations	346

B_{VII}	Addition of more than two angular momenta	347
1	Zero total angular momentum; 3-j coefficients	347
2	6-j Wigner coefficients	351

VIII	Transformation of observables under rotation	355
A	Scalar and vector operators	358
B	Tensor operators	363
C	Wigner–Eckart theorem	379
D	Applications and examples	384
A_{VIII}	Short review of classical tensors	397
1	Vectors	397
2	Tensors	398
3	Properties	401
4	Criterion for a tensor	403
5	Symmetric and antisymmetric tensors	403
6	Specific tensors	404
7	Irreducible tensors	405
B_{VIII}	Second-order tensor operators	409
1	Tensor product of two vector operators	409
2	Cartesian components of the tensor in the general case	411
C_{VIII}	Multipole moments	415
1	Electric multipole moments	416
2	Magnetic multipole moments	428
3	Multipole moments of a quantum system with a given angular momentum J	434
D_{VIII}	Density matrix expansion on tensor operators	439
1	Liouville space	439
2	Rotation transformation	441
3	Basis of the $T_Q^{[K]}$ operators	442
4	Rotational invariance in a system’s evolution	444

IX	Internal symmetries, SU(2) and SU(3) groups	449
A	System of distinguishable but equivalent particles	451
B	SU(2) group and isospin symmetry	466
C	SU(3) symmetry	472

A_{IX}	The nature of a particle is equivalent to an internal quantum number	497
1	Partial or complete symmetrization, or antisymmetrization, of a state vector	497
2	Correspondence between the states of two physical systems	499
3	Physical consequences	501
B_{IX}	Operators changing the symmetry of a state vector by permutation	503
1	Fermions	503
2	Bosons	506

X	Symmetry breaking	507
A	Magnetism, breaking of rotational symmetry	508
B	A few other examples	515
	APPENDIX	521
	Time reversal	521
1	Time reversal in classical mechanics	522
2	Antilinear and antiunitary operators in quantum mechanics	527
3	Time reversal and antilinearity	534
4	Explicit form of the time reversal operator	542
5	Applications	546
