

Contents

1. Introduction – Gyrotrons for thermonuclear fusion applications	1
1.1. Current state of research and the 4 MW power level	3
1.2. Content and structure of this work	4
1.3. The gyro-oscillator – main components and operation principle	5
1.3.1. Electron-cyclotron-interaction	6
1.3.2. Electron gun and beam tunnel	10
1.3.3. Coaxial cavity	16
1.3.4. Quasi-optical output system	24
1.3.5. Collector	26
2. Mode selection and coaxial cavity design	29
2.1. Theory of self-consistent multi-mode simulation	29
2.2. Technical and physical requirements	34
2.3. Formalism of normalized variables	37
2.4. Mode pre-selection process	38
2.5. Self-consistent calculation and cavity optimization	42
2.6. Introduction of nonlinear tapers	45
2.7. Time-dependent multi-mode calculations	48
2.8. Stability areas and cavity outer wall corrugation	53
2.9. Multi-frequency operation (136 GHz / 204 GHz)	55
3. Design of magnetron injection electron guns and the magnetic system	59
3.1. Elementary mathematical theory of magnetron injection guns	60
3.1.1. Busch's theorem	60
3.1.2. Adiabatic approximation	62

3.2.	Requirements for the electron beam	63
3.3.	Technical constraints and additional requirements for the gun layout	68
3.4.	Numerical evaluation and optimization	71
3.4.1.	Design specifications and simulation setup	71
3.4.2.	Utilized numerical implementation	73
3.4.3.	Optimization techniques for the electron gun synthesis	75
3.5.	Design of a diode-type electron gun	77
3.6.	Design of a triode-type electron gun	83
3.7.	Parameter studies for the diode- and triode-type electron gun	91
3.7.1.	Space charge effects	91
3.7.2.	Dependency on the accelerating voltage	93
3.7.3.	Sensitivity to mechanical errors	93
4.	Quasi-optical output system	97
4.1.	Theoretical basics and calculation techniques	97
4.2.	Utilized analysis and optimization routine	103
4.3.	Design results for a two-beam launcher	105
4.4.	Analysis of small deviations on the launcher surface	109
4.4.1.	Smoothening techniques for the launcher surface	109
4.4.2.	Averaging and low-pass filtering of launcher perturbations	111
4.5.	Verification of the launcher design and introduced smoothening	116
5.	Design studies for the collector	121
5.1.	Possible optimization steps for the collector	122
5.2.	Determination of the electron trajectories towards the collector	126
5.3.	Design of a copper collector	127
5.4.	Design of a Glidcop collector	130

6. Thermo-mechanical studies of long-pulse operation effects	135
6.1. Deformation of the coaxial cavity and frequency shift . . .	136
6.1.1. Considerations and theory for the cavity wall loading	136
6.1.2. Steady state temperature distribution	138
6.1.3. Verification and comparison with experimental data	143
6.1.4. Deformation and frequency shift for the 4 MW 170 GHz cavity	146
6.2. Deformation of the impedance corrugation at the coaxial insert	150
6.2.1. SIM and SIE theory	150
6.2.2. Steady state temperature distribution	154
6.2.3. Deformation of the impedance corrugation	161
6.3. Thermal distortion of the launcher surface	163
7. Conclusion and outlook	169
List of Figures	173
List of Tables	179
Bibliography	181
A. Appendix	191
A.1. Glidcop material properties	191
A.2. Geometrical parametrizations for the gun designs	192
Acknowledgement	196
