|-------------------------------------------------------------------------------------|-------------|
| <b>Nomenclature</b>                                                                 | <b>xi</b>   |
| Greek symbols . . . . .                                                             | xi          |
| Latin symbols . . . . .                                                             | xii         |
| Sub/Superscripts . . . . .                                                          | xvi         |
| Abbreviations . . . . .                                                             | xvi         |
| <b>List of Figures</b>                                                              | <b>xvii</b> |
| <b>List of Tables</b>                                                               | <b>xxi</b>  |
| <b>1. Introduction</b>                                                              | <b>1</b>    |
| <b>2. Fundamentals of continuum mechanics and linear elastic fracture mechanics</b> | <b>5</b>    |
| 2.1. Continuum mechanics . . . . .                                                  | 5           |
| 2.1.1. Finite and infinitesimal deformation . . . . .                               | 6           |
| 2.1.2. Fundamentals of linear elasticity . . . . .                                  | 10          |
| 2.1.3. Balance equations . . . . .                                                  | 14          |
| 2.1.4. Interface equilibria . . . . .                                               | 19          |
| 2.2. Linear elastic fracture mechanics . . . . .                                    | 23          |
| 2.2.1. Crack models . . . . .                                                       | 23          |
| 2.2.2. Crack tip near field . . . . .                                               | 26          |
| 2.2.3. Crack tip loading quantities and fracture criteria . . . . .                 | 28          |
| 2.2.4. Derivation of the J-integral from non-equilibrium thermodynamics . . . . .   | 31          |
| 2.2.5. Crack deflection criteria . . . . .                                          | 34          |

|                                                                                         |            |
|-----------------------------------------------------------------------------------------|------------|
| <b>3. A critical review on the complex potentials in LEFM</b>                           | <b>37</b>  |
| 3.1. Brief overview of fundamental work on elastic crack solutions . . .                | 37         |
| 3.2. Commonly applied complex potentials . . . . .                                      | 43         |
| 3.3. The problem of complex roots . . . . .                                             | 47         |
| 3.4. Current approaches encountering the deficiencies . . . . .                         | 51         |
| 3.5. Improved monolithic complex potentials . . . . .                                   | 54         |
| <b>4. Investigations on the loading of cracks with cohesive zones</b>                   | <b>61</b>  |
| 4.1. Cohesive zone models . . . . .                                                     | 61         |
| 4.2. Cohesive zone model in the context of the finite element method .                  | 70         |
| 4.2.1. Theory and implementation . . . . .                                              | 71         |
| 4.2.2. Verification of the implementation . . . . .                                     | 78         |
| 4.3. J-integral for mixed-mode loaded cohesive zones . . . . .                          | 80         |
| 4.3.1. Derivation of the generalized J-integral vector . . . . .                        | 83         |
| 4.3.2. Verification and interpretation based on analytical crack<br>solutions . . . . . | 91         |
| 4.3.2.1. Verification on the example of a Griffith crack . .                            | 91         |
| 4.3.2.2. Discussion of equivalency of J-integral and CTOD                               | 100        |
| 4.3.2.3. Dugdale crack and improved complex potentials .                                | 102        |
| 4.3.3. Challenges in numerical implementation . . . . .                                 | 105        |
| <b>5. Numerical matrix crack tip loading analysis</b>                                   | <b>113</b> |
| 5.1. Methods of crack tip loading analysis . . . . .                                    | 113        |
| 5.1.1. Displacement interpretation method . . . . .                                     | 114        |
| 5.1.2. Modified crack closure integral . . . . .                                        | 115        |
| 5.1.3. Crack tip element method . . . . .                                               | 116        |
| 5.1.4. Enriched modified crack closure integral . . . . .                               | 118        |
| 5.1.5. J-integral . . . . .                                                             | 126        |
| 5.2. Interactions of matrix cracks and perfect or imperfect interfaces .                | 129        |
| 5.2.1. Crack driving forces and energy release rates . . . . .                          | 130        |
| 5.2.2. Numerical investigation of matrix crack tip loadings . . . .                     | 135        |
| <b>6. Matrix crack growth simulations</b>                                               | <b>147</b> |
| 6.1. Algorithm of the crack growth simulation . . . . .                                 | 148        |

|                                                                                        |            |
|----------------------------------------------------------------------------------------|------------|
| 6.2. Interactions of growing matrix cracks and interfaces . . . . .                    | 150        |
| <b>7. Summary and conclusion</b>                                                       | <b>157</b> |
| <b>A. Appendix</b>                                                                     | <b>161</b> |
