1	Introduction	1
1.1	The origin of infinite-dimensional backstepping	2
1.2	Contribution	5
1.3	Outline of the thesis	8
1.4	Remarks on notation	9
2	Backstepping state feedback control design for coupled parabolic PIDEs	11
2.1	Problem formulation	11
2.2	Selection of the target system	19
2.3	The control law and the kernel equations	20
2.4	Closed-loop stability	25
2.4.1	Stability of the target system	26
2.4.2	Invertibility of the backstepping transformation	30
2.5	Solution of the kernel equations	35
2.5.1	Component form of the kernel equations	36
2.5.2	Standard form of the kernel equations	40
2.5.3	Canonical coordinates and the spatial domains	45
2.5.4	Canonical kernel equations	52
2.5.5	Transformation into integral equations	59
2.5.6	Solution by fixed-point iteration	62
2.5.7	Uniqueness and regularity of the kernel	75
2.6	Computation of the kernel derivatives	81
2.7	Academic examples	84
2.8	Concluding remarks	92
3	Backstepping observer design for coupled parabolic PIDEs	93
3.1	Problem formulation	94
3.2	Observer composition	96
3.3	Selection of the target system	97

3.4	Observer gains and the kernel equations	98
3.5	Solution of the observer kernel equations	102
3.6	Stability of the observer error dynamics	103
3.7	Academic example	110
3.8	Observer-based state feedback control	111
3.8.1	Problem formulation	114
3.8.2	Stability of the output feedback control	115
3.8.3	Academic example	126
3.9	Concluding remarks	128
4	Bilateral backstepping control for coupled parabolic PDEs	131
4.1	Problem formulation	133
4.2	Folding transformation	134
4.3	Backstepping transformation	137
4.4	Decoupling transformation	141
4.5	The stabilizing control law	142
4.6	Closed-loop stability	145
4.7	Volterra-kernel integral equations	147
4.7.1	Canonical kernel equations	147
4.7.2	Conversion into integral equations	153
4.8	Volterra-Fredholm-kernel integral equations	158
4.8.1	Canonical kernel equations	159
4.8.2	Kernel integral equations	166
4.9	Successive approximations	169
4.10	Computation of the kernel derivatives	170
4.11	Backstepping observer design for in-domain measurements	172
4.12	Output feedback control	174
4.13	Academic examples	175
4.14	Concluding remarks	180
5	Further research topics	185
A	Relatively bounded operators	187
A.1	Relative boundedness of evaluation operators	188
A.2	Norms of relatively bounded operators	191
B	Proofs	193
B.1	BCs of the inverse kernel equations	193
B.2	Integral estimates	195
B.3	Duality of the kernel equations (proof of Proposition 3.5.1) .	201

B.4	Coupling term properties (proof of Corollary 3.8.4)	205
C	Useful theorems and definitions	209
C.1	Exponential stability	209
C.2	Convergence properties	209
C.3	Calculus	210
C.4	Important inequalities	213
D	Adjoint target systems	215
	Bibliography	221
	Publications of the author	231
	Index	235
	Special symbols	239
