Notation	XXIII
Kurzfassung	XXVII
Abstract	XXIX

1 Introduction	1
2 Current status and environmental assessment of low-carbon technologies	3
2.1 Overview of low-carbon technologies	3
2.1.1 Motivation and definition of low-carbon technologies	3
2.1.2 The carbon cycle of low-carbon technologies	8
2.1.3 Current deployment and technological maturity of low-carbon technologies	14
2.2 Environmental assessment of low-carbon technologies	19
2.2.1 General introduction of life-cycle assessment (LCA)	19
2.2.2 LCA depending on the development stage and model scope	24
2.2.3 Current status of LCA for low-carbon technologies	26
2.3 Contribution of this thesis	30
3 Screening the environmental potential of Carbon Capture Utilization (CCU) – <i>concept level</i>	35
3.1 LCA-based short-cut method for environmental assessment	36
3.1.1 LCA-based short-cut method	36
3.1.2 Environmental impact reduction and feedstock efficiency	38
3.1.3 Selection of CO ₂ -based processes	39
3.1.4 Data source	47

3.2	Environmental assessment of the CO ₂ -based reactions	49
3.2.1	Environmental impact reductions for CO ₂ -based reactions	49
3.2.2	Feedstock efficiency and annual climate impact reduction potential	56
3.3	Summary and conclusions	60
4	Environmental potential of novel CO₂-based fuels – <i>process level</i>	63
4.1	Introduction to oxymethylene ether (OME) fuels	64
4.2	Goal and scope of the environmental assessment of OME ₁ -blends	65
4.3	LCI data for the OME ₁ -blends	68
4.3.1	OME ₁ production	69
4.3.2	OME ₁ -blend combustion	74
4.4	Environmental impacts of OME ₁ -blends	75
4.4.1	From cradle-to-gate: production of OME ₁	76
4.4.2	From gate-to-grave: combustion of OME ₁ -blends	77
4.4.3	From cradle-to-grave: environmental impacts and blending effectiveness factor	80
4.4.4	Sensitivity on OME ₁ production scenarios	81
4.5	Summary and conclusions	84
5	Industrial case study on direct air capture (DAC) – <i>plant level</i>	87
5.1	Goal and scope for the environmental assessment of CO ₂ from DAC . .	88
5.1.1	Process description	88
5.1.2	Goal and scope definition	89
5.1.3	System boundaries	90
5.1.4	Functional unit	91
5.1.5	Environmental impacts and normalization	92
5.1.6	Carbon capture efficiency and carbon removal efficiency	92
5.2	LCI for the environmental assessment of CO ₂ from DAC	93
5.2.1	Adsorbents	93
5.2.2	DAC plant	97
5.2.3	Energy scenarios	98
5.2.4	Applications for the captured CO ₂	101
5.2.5	Capturing 1 % of global annual CO ₂ emissions	102
5.3	Environmental assessment of CO ₂ from DAC	103
5.3.1	Climate impacts of captured CO ₂ from cradle-to-gate	103
5.3.2	Adsorbents	105
5.3.3	DAC plant	108

5.3.4	Climate impacts of captured CO ₂ from cradle-to-grave	109
5.3.5	Capturing 1 % of the global annual CO ₂ emissions	110
5.4	Summary and conclusion	113
6	Integration of LCA into energy system design – <i>system level</i>	115
6.1	Sector-coupled national energy system model	116
6.1.1	Model overview	116
6.1.2	Integration of LCA	119
6.2	Transition pathway of the German energy system	122
6.2.1	Energy transition pathway	122
6.2.2	Energy transition pathway including carbon dioxide removal (CDR)	132
6.2.3	Discussion of the results	137
6.3	Summary and conclusion	139
7	Summary, conclusions, critical discussion and perspective for future research	141
7.1	Summary and conclusions	141
7.2	Critical discussion and perspective for future research	145

Appendices

A	Screening Carbon Capture and Utilization (CCU)	151
A.1	LCA-based short-cut method	151
A.1.1	Relative deviation for the fossil-based processes	153
A.2	CO ₂ -based processes	159
A.2.1	Feedstock quantities for CO ₂ and H ₂	159
A.2.2	Corresponding fossil-based processes	161
A.2.3	Global annual production capacities	174
A.3	Supply scenarios	175
A.4	LCI datasets	177
A.5	Non-renewable cumulative energy demand	182
B	Oxymethylene ether (OME) fuels	185
B.1	LCI of OME ₁ production	185
B.2	Specification of the single cylinder and emission measurement equipment	192

B.3	Environmental impacts of the OME ₁ -blend	194
B.4	Sensitivity analysis of the H ₂ and the electricity storage	199
C	Direct air capture (DAC)	201
C.1	LCI data	201
C.1.1	Adsorbents	201
C.1.2	DAC plant	211
C.1.3	Energy scenarios	213
C.1.4	Applications	220
C.1.5	Market shares	221
C.1.6	Land use intensity	221
C.2	Environmental impacts	222
C.2.1	Adsorbents	222
C.2.2	DAC plant	234
C.2.3	Energy Scenarios	243
C.2.4	Sensitivity study Hinwil	257
D	Sector-coupled energy system MODEL (SecMOD)	259
D.1	Transition path	260
D.1.1	Greenhouse gas emission targets	260
D.1.2	Rolling horizon	261
D.1.3	General equations for the synthesis optimization	263
D.1.4	General equations for the operational optimization	267
D.1.5	LCI data	271
D.2	Power sector	275
D.2.1	Technologies in the power sector	275
D.2.2	Demand structure	281
D.2.3	Description of specific technologies	283
D.2.4	LCI data	303
D.3	Heating sector	312
D.3.1	Technologies in the heating sector	312
D.3.2	Demand structure	315
D.3.3	Description of specific technologies	320
D.3.4	LCI data	322
D.4	Transportation sector	326
D.4.1	Total annual mileage	326
D.4.2	Allocation of the existing initial vehicle fleet	327
D.4.3	Vehicle technologies	328

D.4.4	LCI data	341
D.5	Environmental impacts	350
D.5.1	Electricity sector	350
D.5.2	Heating sector	353
D.5.3	Transportation sector	357
D.6	Energy transition pathway including CDR	360
