

Contents

Introduction — V

1 Systems of linear equations — 1

- 1.1 Gaussian elimination — 1
- 1.2 Using matrices — 8
 - 1.2.1 Complete forward elimination — 13
- 1.3 Vector interpretation of linear systems — 17
- 1.4 Solution set of a linear system $Ax = b$ — 23
- 1.5 Linear dependence and independence — 27

2 Matrix algebra — 34

- 2.1 Matrix operations — 34
- 2.2 The inverse of a square matrix — 39
- 2.3 LU decomposition — 47
- 2.4 Subspaces, bases, and dimension — 52
- 2.5 Null and column spaces — 57

3 Determinants — 64

- 3.1 Cofactor expansion — 64
- 3.2 Properties of determinants — 67
- 3.3 Cramer's rule — 75
 - 3.3.1 Vector product — 78
 - 3.3.2 Block matrices — 80

4 Eigenvectors and eigenvalues — 85

- 4.1 Characteristic equation — 85
 - 4.1.1 Properties of eigenvectors and eigenvalues — 88
- 4.2 A complete set of eigenvectors — 93
 - 4.2.1 Complex eigenvalues — 96
- 4.3 Diagonalization — 98

5 Orthogonality and symmetry — 105

- 5.1 Inner products — 105
- 5.2 Orthogonal bases — 109
- 5.3 Gram–Schmidt orthogonalization — 117
 - 5.3.1 QR factorization — 119
 - 5.3.2 Orthogonal matrices — 121
- 5.4 Linear transformations — 126
- 5.5 Symmetric transformations — 131

5.6	Quadratic forms —	140
5.7	Vector spaces —	149
6	Systems of differential and difference equations —	156
6.1	Linear systems with constant coefficients —	156
6.2	A pair of complex conjugate eigenvalues —	163
6.3	The exponential of a matrix —	168
6.4	The general case of repeated eigenvalues —	174
6.5	Nonhomogeneous systems —	186
6.6	Difference equations —	200
7	Applications to Calculus and Differential Geometry —	208
7.1	Hessian matrix —	208
7.2	Jacobian matrix —	215
7.3	Curves and surfaces —	219
7.4	The first fundamental form —	227
7.5	The second fundamental form —	234
7.6	Principal curvatures —	241
Bibliography — 247		
Index — 249
